The effects of the oil counter-shock: The best is yet to come!

By <u>Eric Heyer</u> and <u>Paul Hubert</u>

After falling sharply over the past two years, oil prices have been rising once again since the start of the year. While a barrel came in at around 110 dollars in early 2014 and 31 dollars in early 2016, it is now close to 50 dollars.

Will this rise in oil prices put a question mark over the gradual recovery that seems to have begun in France in 2016?

In a recent study, we attempted to answer three questions about the impact of oil prices on French growth: will a change in oil prices have an immediate effect, or is there a time lag between the change and the impact on GDP? Are the effects of rises and falls in oil prices asymmetrical? And do these effects depend on the business cycle? The main results of our study can be summarized as follows:

- 1. There is a time lag in the impact of oil price variations on French GDP. Over the period 1985-2015 the lag was on average about 4 quarters;
- 1. The impact, whether downward or upward, is significant only for variations in oil prices greater than 1 standard deviation:
- 2. The asymmetric effect is extremely small: the elasticity of growth to oil prices is the same whether the price rises or falls. Only the speed at which the impact is transmitted differs (3 quarters in the case of a rise, but 4 in the case of a fall);
- 3. Finally, the impact of oil price changes on economic activity depends on the phase in the business cycle: the

elasticity does not differ significantly from zero in situations of a "crisis" or a "boom". However, the elasticity is much greater in absolute terms when the economy is growing slowly (an economic slump).

Let us now apply these results to the situation since 2012. Between the first quarter of 2012 and first quarter of 2016, the price of a barrel of Brent crude plummeted from 118 dollars to 34 dollars, a fall of 84 dollars in four years. If we factor in the euro/dollar exchange rate and changes in consumer prices in France, the fall amounts to a 49 euro reduction over the period (Figure 1).

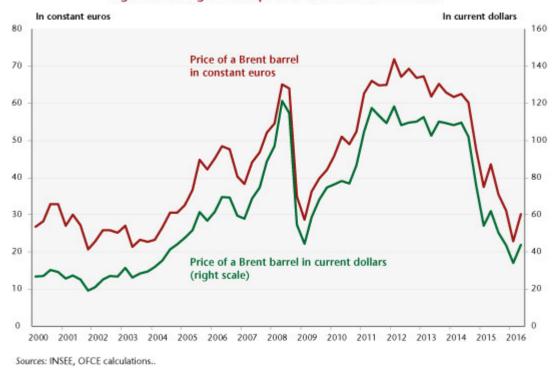

Figure 1. Changes in the price of a barrel of Brent crude

We evaluated the impact of a decline like this on France's quarterly GDP, taking into account the above-mentioned time lag, asymmetry and phase of the business cycle.

Factoring all this in indicates that the oil counter shock ultimately did not show up much in 2015. As illustrated in Figure 2, the impact should make itself felt from the first quarter of 2016, regardless of the hypotheses adopted. The positive effect of the oil counter-shock is yet to come!

What Donald Trump's economic programme reveals

By <u>Xavier Ragot</u>

The US elections are proving to be very revealing. Three different perspectives on the current elections are yielding insights into three areas: first, on the state of the US economy, second, on the state of the thinking of economists, and finally, on the nature of the relationship between economists and politicians.

The US primaries were marked by both the "resistible rise" of Donald Trump and the emergence of Bernie Sanders, who has hit Hilary Clinton from the left but failed to win.

The success of Donald Trump, who circumvented the Republican

Party, was based on policy mainsprings that draw on some paranoia about the loss of identity of the United States in the face of concessions made economically to China, politically to Iran, and militarily in Iraq. The country's loss of status is a very real topic in the United States. The success this theme has enjoyed also stems from the reality of the economic situation of the middle and working classes in the US. The social scars caused by inequality in the country, so elegantly studied by Thomas Piketty, are visible on the streets, reflecting the reality of unequal access to health care (so incomprehensible to a European). While this theme of inequality is the central focus of the Bernie Sanders campaign, popular anger is also being expressed in the Republican camp.

Donald Trump's economic programme has the poetic but disturbing charm of a ramshackle inventory. By European standards it is difficult to identify it as right, extreme right or left. Trump does have a formal fiscal programme, but it has been significantly "enriched" by media interventions. He is in favour of investment in infrastructure and military spending, the reduction of taxes, an increase in the minimum wage, an end to Obamacare and the total privatization of health care, the taxation of the rich, a reduction of immigration, especially from Mexico (building a wall between the US and Mexico), an aggressive trade policy toward China, which he accuses of dumping and, more recently, a partial default on US public debt. This last point has caused serious waves among Republicans. The United States is one of the world's few countries to have never defaulted on its public debt, so the Republican candidate publicly raising this possibility comes as a shock.

On this last point, I personally think that defaulting on public debt is a bad idea. This amounts to an uncontrolled tax, without assumption of responsibility, and it can also add to banking instability. Much better would be to impose a tax

after a democratic debate. Furthermore, to ease the public debt burden, it is always possible to lower real interest rates on the public debt for a number of years using an accommodative monetary policy, without financial repression (see the article by Blanchard, Dell'Ariccia and Mauro).

Few economists defend Donald Trump's programme, even the part that sticks strictly to economics. A fairly positive interpretation of Trump's programme recently gained attention, as it came from a recognized and respected economist, Narayana Kocherlakota (here). Before getting into the reasons for Kocherlakota's (very relative) support for Trump, it is worth reviewing this economist's career to see how a crisis can change the way economists think. Narayana Kocherlakota trained as an economist at the University of Chicago, and he has made fundamental, highly technical contributions to financial theory, monetary theory and the dynamic theory of public finances, which are based on the application of tools from intertemporal contract theory. This is a very serious academic! Kocherlakota wrote a text on the state of macroeconomic thought post-crisis that is very interesting because it is based on the broad vision of a researcher who doesn't recognize his discipline when he looks at economics textbooks (not to mention popular texts). Kocherlakota became chair of the Federal Reserve of Minneapolis in 2009 (stepping down on 1 January 2016). The Minneapolis Fed is known as a hard-core, intellectually active outpost of "anti-Keynesian" thought, to put it in a nutshell. Kocherlakota went through a profound intellectual transformation while at the Fed and took a fairly radical Keynesian turn (here is one original theoretical contribution), which led to conflicts with his colleagues. What was missing in Kocherlakota's academic output? What economic facts destabilized him to such an extent?

It is obviously difficult to answer these questions. However, it could be argued that Kocherlakota's own work did not make

it possible to foresee the effectiveness of unconventional monetary policy or the impact of Obama's fiscal stimulus plans. Indeed, the US government conducted a very Keynesian monetary and fiscal policy (tax cuts and massive monetary creation), which had positive effects that could not be encompassed by the models of the Minneapolis Fed. The major missing ingredients were the nominal rigidities that give aggregate demand a potentially important role. This issue of nominal rigidities is not a detail in macroeconomics. I have written a text about the return of Keynesian thinking on this issue.

Kocherlakota's indulgence of the Trump programnme is not therefore that of a hard-core free marketer, but rather that of a converted Keynesian, whose faith seems a bit extreme. Kocherlakota is selling Trump's Keynesian stimulus based on public spending and lowering taxes. His only concern is that he would like to be sure that Trump would accept higher inflation of around 4% rather than 2%.

Thus, the Trump programme is further blurring the lines between the economic policy of the left and the right. The theme of inequality and impoverishment is dominating debate in the middle and working classes. The global problem of lack of demand and underemployment is worrying economists under the rubric of secular stagnation. The emergence of Bernie Sanders, the hodge-podge of Trump's economic programme (the violence of his remarks on immigration is not the subject of this text), and on another scale, Kocherlakota's transformation, all reveal the difficulty facing the emergence of a coherent economic paradigm that has a broad social base. Policy (Republican and Democratic) is groping for a different articulation between the State and the market, a coherent and effective return of economic policy (fiscal and monetary) that is able to stabilize market economies and reduce inequality. This debate will be identical, but, due to the European issue, will take a different form in France's presidential elections.

Is the decline of industry due to the growth of services?

By <u>Sarah Guillou</u>

On Friday, April 8 2016, the Observatoire Français des Conjonctures Economiques (OFCE) began a series of quarterly seminars on the analysis of France's productive network. The purpose is to bring together researchers and discussion of the situation, the diversity and the heterogeneity of the companies making up France's production system. This discussion is now being fed by the increasing use of business data. We hope in this way to enrich the analysis of the strong and weak points in the country's production fabric, with a view to guiding the development of public policies aimed at strengthening it.[1]

The first seminar took up the role of services in deindustrialization as measured by the decline of industrial employment as a share of total employment. Since 2000, the manufacturing industry in France has lost more than a quarter of its work force, i.e. more than 900,000 jobs. A recent note by the INSEE (Insee Première, No 1592) points out that manufacturing's weight in the economy has been halved from 1970 to today. Even though deindustrialization has aroused greater attention in France than elsewhere, probably because of the country's interventionist tradition and the challenges facing its labour market, it is taking place in all the developed economies. This raises questions about underlying

structural trends common to all these countries.

However, the decline in industrial employment is being accompanied by net job creation in services. It also appears that the growth of services is being driven in part by changes in industrial production methods. Products are incorporating an increasingly large component of services, and companies are expanding their portfolio of service products. The fragmentation of production processes — fuelled by the opportunities provided by globalization — is isolating low value-added manufacturing units from high value-added services units.

These changes in production methods need to be analysed to understand the extent of this phenomenon. It seems that the changes occurring within industry are just as much factors driving the decline of industry as the rise of services in employment. In other words, there is a question of how much deindustrialization finds a mirror image in the growth of services, or even its explanation.

Three contributions helped to provide some answers to the following questions: which manufacturers are producing services and with what impact on their performance? What is the role of services in the development of global value chains? Are flows of international services replacing flows of goods? Three main lessons emerge.

1 — "Servitization" and the decline in manufacturing jobs are clearly correlated

Manufactured products are incorporating an increasingly significant amount of services. This can be seen both by the growing share of companies that produce services (Crozet and Millet, 2015) and export them (Castor et al., 2016) and by the rising content of services in exports (Miroudot, 2016)[2].

The growth in companies' value-added "services" may well push all their jobs into the service sector, including what are

strictly speaking manufacturing jobs, if the added value of the services becomes dominant. Today an average of 40% of manufacturing employment corresponds to service activities. Furthermore, the fragmentation of production processes is intensifying, as is the distribution around the world of outsourced activities based on the comparative advantages of different locations. If the company maintains an anchor in the home country, it usually keeps only the higher value-added jobs there, in line with the cost of the related work and qualifications, meaning jobs often characterized as services.

Note that these changes in production methods clearly reflect a decrease in manufacturing functions in a product's added value, which translates into a decline of manufacturing in the sources of the wealth of nations. But it is important not to underestimate the impact of the fragmentation of production units. Thus, jobs in services, formerly attributed to manufacturing, are being reclassified as service jobs even though the underlying production task has not changed, and this is happening regardless of outsourcing abroad.

However, this reclassification is all the more likely as "servitization" accelerates and becomes a must for companies to remain competitive.

2 - The servitization of manufacturing is a competitive factor

Servitization, which is associated with qualitative improvements in products and more generally the creation of value in manufacturing, is a factor in competitiveness.

As is shown by Crozet and Millet (2015), the production of services by manufacturing enterprises is a factor that enhances their performance. There are actually many French manufacturing companies that produce services, with 70% producing these for third parties (2007 data). The decision to produce services represents an important turning point, and clearly boosts performance. The authors' estimates thus show

that taking this decision raises profitability, employment, total sales and sales of goods. Even though there are sectoral variations, the impact on performance is positive, whatever the industrial sector in question.

At the aggregate level, the share of imported services in the export of goods is also growing. In France's exports, the share of services ranges from 30% to 50%, depending on the sector. The fragmentation of production processes is leading to outsourcing certain service functions and to the provision of imported services. This dynamic goes hand in hand with the integration of economies in international trade, with the benefit of globalization opportunities and ultimately with the competitiveness of economies (see <u>De Backer and Miroudot</u>, 2013).

3 - The direct and indirect export of services will continue to make a positive contribution to the trade balance

The developments described above directly affect the trade in services. It is indeed increasingly services that are the subject of trade in intermediate products, with the latter being estimated at nearly 80% of world trade. Digitalization, along with differentiation through services, is leading to the fragmentation of production with the inclusion of more and more services.

Trade in services in France has not experienced a decline since the crisis of 2007. Even though the trade balance in services has shrunk slightly since 2012, it has remained positive since the start of the 21st century, and the export of services has been rising faster than for goods. As the world's third largest exporter of services — especially because of tourism — France will see service exports increase as a share of its trade balance. Admittedly, for the moment, the volume of exported services has not offset the negative balance for goods, but the development of intra-firm trade in services and of intermediary services will eventually reverse

their respective shares.

Trade in services is even more concentrated than trade in goods. It is mainly carried out by French or foreign multinational corporations, which account for more than 90% of this trade. While just over half of trade takes place with the European Union (EU), this component is running a deficit, while non-EU trade is running a surplus. It is interesting to note that the balance is positive for companies that are part of a French group, but negative for companies belonging to a foreign group (Castor et al., 2016).

In conclusion

It seems that the dichotomy between industry and services is becoming increasingly inappropriate to describe the dynamics of employment and the productive specialization of economies. An approach in terms of productive functions that breaks down the job properly based on whether it involves manufacturing activities strictly speaking or other activities, such as transportation and logistics, administrative support or R&D services, would allow a better understanding of a country's skills and comparative advantages.

More generally, the growth of services and their increasing role in production and exports is giving them an increasingly central role in economic growth. Getting better statistics on the production and export of services and improving the methods of assessing productivity in services are prerequisites for a better understanding of the role of services in growth and of the levers to be activated to achieve this.
