

Plea for a growth pact: the sound and fury hiding a persistent disagreement

By [Jean-Luc Gaffard](#) and [Francesco Saraceno](#)

The emphasis on the need to complement fiscal restraint by measures to boost growth, which is rising in part due to the electoral debate in France, is good news, not least because it represents a belated recognition that austerity is imposing an excessively high price on the countries of southern Europe.

Nevertheless, there is nothing new about invoking growth, and this may remain without consequence. In 1997, as a result of a French government intervention, the Stability Pact became the Stability and Growth Pact, but this had no significant impact on the nature of strategy, which remained fully oriented towards the implementation of strict monetary and fiscal rules and a constant search for more flexible markets.

Last week, [Mario Draghi](#), along with [Manuel Barroso and Mario Monti](#), were worried not only about the recession taking place in Spain, Portugal, the Netherlands and Great Britain but also about the need to respond formally to a request that may come from a new French government. They too are arguing for a negotiated Growth Pact, while taking care to note that it must consist of a common commitment to carry out structural reforms wherever they have not yet been made. This position echoes the February [letter](#) of the eleven Prime Ministers to the European authorities. In other words, nothing is to change in the doctrine that determines the choice of Europe's economic policy: growth can be achieved only through structural reform, in particular of the labour markets.

There are two grounds for criticizing this position. [It is far from sure](#) that structural reform is effective, unless, that

is, it is wielded in a non-cooperative spirit to improve the competitiveness of the country that undertakes the reform at the expense of its trading partners, as Germany was able to do with the Hartz reforms. Secondly, widespread reform, including where this is justified in terms of long-term growth, would initially have a recessionary impact on demand [\[1\]](#), and hence on activity. Reform cannot therefore deal with what is actually the immediate top-priority requirement, namely stemming the spreading recession.

The real challenge facing Europeans is to reconcile the short term and the long term. The solution proposed so far, general fiscal austerity aimed at [restoring the confidence of private actors](#), which would be complemented by structural reforms intended to increase the potential growth rate, just doesn't work. This can be seen by developments in Greece, as well as in Portugal and Ireland, which are model students of Europe's bailout plans, and also in Britain, Italy and Spain. The fiscal multipliers remain firmly Keynesian (see [Christina Romer](#), and [Creel, Heyer and Plane](#)), and any "non-Keynesian" effects on expectations are limited or nonexistent.

Growth can neither be decreed nor established instantly, unlike the deflationary austerity spiral in which more and more European countries are currently trapped.

Growth is likely to materialize only if fiscal consolidation is neither immediate nor drastic – in fact, only if the consolidation required of countries in difficulty is spread over time (beyond the year 2013, which in any case will be impossible to achieve) and if the countries that are able to carry out a more expansionary fiscal policy actually do this in such a way that at the European level the overall impact is neutral or, even better, expansionary. This strategy would not necessarily be punished by the markets, which have shown recently that they are sensitive to the requirement for growth. Otherwise, steps should be taken by the ECB to deal with the constraints imposed by the markets. This short-term

support must be accompanied by substantial medium-term investment made through European industrial programs financed by the issuance of Eurobonds – which would mean, finally, a European budget on a scale large enough to handle the tasks facing the Union. This method of coordinating short- and medium-term choices would be an important step towards the establishment of the kind of federal structure that alone will allow the resolution of the “European question”.

The middle class: baseless fears or genuine hardship?

By Louis Chauvel

The term “middle class” is one of those social science concepts that provoke controversy due to its complex definition and dynamics and the political debate it generates. The fact that it is surrounded by sharp controversy should not therefore come as a big surprise. [In a note by the OFCE](#) – where a multifaceted definition of the middle class is proposed [1] – we review several dimensions of the social malaise afflicting this social group, which is often

considered to be relatively privileged, in an effort to understand the actual situation.

Two theses are considered here:

– on the one hand, the thesis of the middle class maintaining its former status, the strengthening of the protection its members enjoy and confirmation of their economic ascent [2] – a thesis that makes the “fear of decline” that haunts them a paradox;

– on the other hand, the thesis of an objective increase in social problems that were previously limited to people in lower strata (employees and workers, two social groups whose hourly wages are similar), with the upwards diffusion of the problems through capillary action now less blocked [3].

Proponents of the optimistic thesis, that of maintenance, argue that “contrary to popular belief”, the fall in status of the middle class is a “fiction”, as this social group “simultaneously embodies a ‘France holding its own’ and a ‘France that’s rising’” (Goux and Maurin). In this view, fear of decline is a psychological reaction of the middle class with no real cause.

In the Note, which upholds a different view, we review several aspects of this analysis to understand the objective basis for the malaise of the middle class. We show that the increasing difficulties faced by lower strata – for example, the risk of unemployment – are seeping into the intermediate middle classes, who can no longer be said to be protected. This is an element of the “theory of the lump of sugar at the bottom of the cup of coffee”: while the upper and middle parts of society still seem intact, erosion is continuing through the capillary-like action of the immersed part and, if nothing is done, it threatens inevitable deterioration.

Ratio between the net annual full-time salary of the intermediate professions and that of manual workers (men and women, separately)

Note: An in-depth examination shows that over the last 50 years workers and employees have experienced similar changes in wages.

Source: DADS data, private and semi-public sector.

The relative standard of living of the intermediate middle class peaked in what the French call the “Trente glorieuses”, the three decades of post-war prosperity: since the end of this golden age, stagnant wages and incomes, the reduction of wage differentials with the lower classes holding jobs (see chart), the unprecedented risk of unemployment, the numerical expansion of diplomas to numbers that go well beyond the space available in the intermediary professions, and the consequent devaluation of education, etc., were a number of the problematic issues analyzed in this paper that highlight the existence of a very real malaise. It is thus possible to show that, in terms of diplomas, the intermediate middle class population increasingly consists of a share of potential managers (based on their level of education) who have not actually managed to enter the upper middle class, due to a lack of sufficient places, and on the other hand survivors of the intensified competition, a reflection of the growing number of people with the same level of education who have fallen into the lower classes.

In this note, we therefore consider the cause of the

destabilization of the project of “middle class civilization” (Alexandre Koyré) that had emerged in the context of the growth and modernity that marked the 1960s to 1980. The corresponding social dynamics were not based simply on the numerical expansion of the intermediate middle class, but also on a coherent social and political project that has now become unstable. What are the ways to reconnect with this dynamic? How would it be possible to escape the vicious circle whereby the middle classes disintegrate and we develop policies targeted at those most in need without seeing that they feed the fall of groups that were previously better situated but that haven’t been supported? The answer lies in productive investment in sectors with long-term promise. Without coming to terms with the real causes of the malaise of the intermediate middle class and dealing with the root problems, we may be preparing ourselves for a difficult decade.

[1] The middle class is defined in their plurality as falling into the upper middle classes, comparable to the “executives and intellectual professions” who make up about 10% of households, and the intermediate middle classes, which corresponds to the 20% located immediately below, and thus close to the intermediary professions as defined by the INSEE.

The financial markets: Sword of Damocles of the presidential election

By [Céline Antonin](#)

Although some of the candidates may deny it, the financial risk linked to the fiscal crisis in the euro zone is the guest of honour at the presidential campaign. As proof that this is a sensitive issue, the launch in mid-April of a new financial product on French debt crystallized concerns. It must be said that this took place in a very particular context: the Greek default showed that the bankruptcy of a euro zone country had become possible. Despite the budgetary firewalls in place since May 2010 (including the European Financial Stability Fund), some of France's neighbours are facing a lack of confidence from the financial markets, which is undermining their ability to meet their commitments and ensure the fiscal sustainability of their government debt, the most worrying example to date being Spain. What tools are available to speculators to attack a country like France, and what should be feared in the aftermath of the presidential election?

The tool used most frequently for speculation on a country's public debt is the Credit Default Swap, or CDS. This contract provides insurance against a credit event, and in particular against a State's default (see the "Technical functioning of CDS" annex for more detail). Only institutional investors, mainly banks, insurance companies and hedge funds, have direct access to the CDS market on sovereign States [\[1\]](#).

Credit default swaps are used not only for coverage, but also

as an excellent means of speculation. One criticism made of the CDS is that the buyer of the protection has no obligation to hold any credit exposure to the reference entity, i.e. one can buy CDS without holding the underlying asset ("naked" purchase/sale). In June 2011, the CDS market represented an outstanding notional amount of 32,400 billion dollars. Given the magnitude of this figure, the European Union finally adopted a Regulation establishing a framework for short-selling: it prohibits in particular the naked CDS on the sovereign debt of European States, but this will take effect only on 1 November 2012.

The FOAT: new instrument for speculation on French debt?

This new financial instrument, introduced by Eurex on April 16 [2], is a futures contract, that is to say an agreement between two parties to buy or sell a specific asset at a future date at a price fixed in advance. The specific asset in this case is the French Treasury OAT bond, with a long residual maturity (between 8.5 and 10.5 years) and a coupon of 6%, and it has a face value of 100,000 euros. Should we worry about the launch of this new contract on the eve of the presidential election? Not when you consider that the launch of the FOAT addresses the gap in yields between German and French bonds that has arisen since the recent deterioration of France's sovereign rating: previously, as German and French bond yields were closely correlated, the FOAT on German bonds allowed coverage of both German and French bond risks. After the gap in yields between the two countries widened, Eurex decided to create a specific futures contract for French bonds. Italy witnessed this same phenomenon: in September 2009, Eurex also launched three futures contracts on Italian government bonds [3]. In addition, Eurex is a private market under German law, and is much more transparent than the OTC market on which CDS are traded. Note that the FOAT launch was not very successful: on the day it was launched, only 2,581 futures contracts were traded on French bonds, against

1,242,000 on German bonds and 13,671 on Italian bonds [\[4\]](#).

Even if, as with the CDS, the primary function of the FOAT is to hedge against risk, it can also become an instrument for speculation, including via short selling. While speculation on French debt was previously limited to large investors, with an average notional amount of 15 billion euros per CDS [\[5\]](#), the notional amount of the new FOAT contract is 100,000 euros, which will attract more investors into the market for French debt. If speculators bet on a decline in the sustainability of France's public finances, then the price of futures contracts on the OAT bonds will fall, which will amplify market movements and result in higher interest rates on OAT contracts.

The not so rosy future?

It is difficult to predict how the financial markets will behave in the wake of the French presidential election. Studying what has happened in other euro zone countries is not very informative, due to each one's specific situation. The country most "comparable" to France would undoubtedly be Italy. However, the appointment of Mario Monti in November 2011 took place in an unusual context, where the formation of a technocratic government was specifically intended to restore market confidence through a strenuous effort to reduce the deficit, with Italy also benefitting from the ECB's accommodative policy.

The [French budgetary configuration is different](#), as the financial imperative appears only in the background. The candidates of the two major parties both advocate the need to restore a balanced budget. Their timetables are different (2016 for Nicolas Sarkozy's UMP, 2017 for François Hollande's PS), as are the means for achieving this: for Sarkozy, the focus will be more on restraint in public spending (0.4% growth per year between 2013 and 2016, against 1.1% for the PS), while Hollande emphasizes growth in revenue, with an

increase in the tax burden of 1.8% between 2012 and 2017 (against 1% for the UMP).

But this is not the heart of the matter. What is striking, beyond the need to reduce public deficits in the euro zone countries, is the fact that our destinies are inextricably linked. As is shown by the graph on changes in bond yields in the euro zone (Figure 2), when the euro zone is weakened, all the countries suffer an impact on their risk premium relative to the United States and the United Kingdom, although to varying degrees. It is therefore unrealistic to think about France's budget strategy and growth strategy outside of a European framework. What will prevent the financial markets from speculating on a country's debt is building a Europe that is fiscally strong, has strict rules, and is supported by active monetary policy. This construction is taking place, but it is far from complete: the EFSF does not have sufficient firepower to help countries in difficulty; the growth strategy at the European level agreed at the summit of 2 March 2012 needs to be more comprehensive; and the ECB needs to pursue an active policy, like the Fed, which specifically requires a revision of its statutes. As was pointed out by Standard and Poor's when it announced the downgrade of the French sovereign rating last December, [what will be watched closely by the financial markets is the fiscal consistency of the euro zone.](#) On 6 May 2012, what attitude will the next President then take vis-à-vis the construction of the budget and how able will he be to assert his position in the euro zone – this will determine the future attitude of the financial markets, not only vis-à-vis France, but also vis-à-vis every euro zone country.

Figure 1. Average yields on 10-year bonds in the euro zone, the United States and the United Kingdom

Annex: Technical functioning of Credit Default Swaps

The contract buyer acquires the right to sell a benchmark bond at its face value (called the “principal”) in case of a credit event. The buyer of the CDS pays the seller the agreed amounts at regular intervals, until maturity of the CDS or the occurrence of the credit event. The swap is then unwound, either by delivery of the underlying instrument, or in cash. If the contract terms provide for physical settlement, the buyer of the CDS delivers the bonds to the seller in exchange for their nominal value. If the CDS is settled in cash, the CDS seller pays the buyer the difference between the nominal amount of the buyer’s bonds and the listed value of the bonds after the credit event (recovery value), in the knowledge that in this case the buyer of the CDS retains its defaulted bonds. In most cases, the recovery value is determined by a formal auction process organized by the ISDA ([International Swaps and Derivatives Association](#)). The annual premium that the bank will pay to the insurance company for the right to coverage is called the CDS spread and constitutes the value listed on the market: the higher the risk of default, the more the CDS spread increases (Figure 1). In reality, as the banks are both the buyers and sellers of protection, the spread is usually

presented as a range: a bank can offer a range from 90 to 100 basis points on the risk of a French default. It is thus ready to buy protection against the risk of default by paying 90 basis points on the principal but it demands 100 to provide that protection.

To illustrate this, consider the following example. On 7 May 2012, a bank (buyer) signs a CDS on a principal of 10 million euros for five years with an insurance company (seller). The bank agrees to pay 90 basis points (spread) to protect against a default by the French State. If France does not default, the bank will receive nothing at maturity, but will pay 90,000 euros annually every 7 May for the years 2012-2017. Suppose that the credit event occurs on 1 October 2015. If the contract specifies delivery of the underlying asset, the buyer has the right to deliver its French bonds with a par value of 10 million euros and in exchange will receive 10 million euros in cash. If a cash settlement is expected, and if the French bonds are now listed only at 40 euros, then the insurance company will pay the bank 10 million minus 4 million = 6 million euros.

[1] Individuals can play on the markets for corporate CDS via trackers (collective investment in transferable securities that replicates the performance of a market index).

[2] The Eurex was created in 1997 by the merger of the German futures market, Deutsche Termin-Börse (DTB), and the futures market in Zurich, the Swiss Options and Financial Futures Exchange (SOFFEX), to compete with the LIFFE. It belongs to Deutsche Börse and dominates the market for long-term financial futures.

[3] In September 2009 for bonds with long residual maturities (8.5 to 11 years), October 2010 for bonds with short residual maturities (2 to 3.25 years) and July 2011 for bonds with average residual maturities (4.5 to 6 years).

[4] Note that this comparison is biased due to the fact that there are 4 types of futures contracts on German debt, 3 on Italian debt and only 1 on French debt.

[5] Weekly data provided by the [DTCC](#) for the week of 9 to 13 April 2012 on CDS on French sovereign debt: the outstanding notional amount came to 1,435 billion dollars, with 6822 contracts traded.

The misfortunes of virtue*

By [Christophe Blot](#)

** This text summarizes the outlook produced by the Department of Analysis and Forecasting for the euro zone economy in 2012-2013, which is available in French on the [OFCE web site](#)*

The euro zone is still in crisis: an economic crisis, a social crisis and a fiscal crisis. [The 0.3% decline in GDP in the fourth quarter of 2011](#) is a reminder that the recovery that began after the great drop of 2008-2009 is fragile and that the euro zone has taken the first step into recession, which will be confirmed in early 2012.

The fall in the average long-term government interest rate in the euro zone seen since the beginning of the year has come to a halt. After reaching 3.25% on 9 March, it rose again due to new pressures that emerged on Italian and Spanish rates. Indeed, despite the agreement to avoid a default by Greece, Spain was the source of new worries after the announcement that its budget deficit had reached 8.5% in 2011 – 2.5 points above the original target – and the declaration that it would not meet its commitments for 2012, which has reinforced doubts about the sustainability of its debt. The Spanish situation illustrates the close link between the macroeconomic crisis and the sovereign debt crisis that has hit the entire euro zone. The implementation of fiscal adjustment plans in Europe, whose impact is being amplified by strong economic interdependence, is causing a slowdown or even a recession in various euro zone countries. The impact of synchronized restrictions is still being underestimated, to such an extent that governments are often being assigned targets that are difficult to achieve, except by accepting an even sharper recession. So long as the euro zone continues to be locked in a strategy of synchronized austerity that condemns in advance any resumption of activity or reduction in unemployment, the pressure will not fail to mount once again in 2012. Long-term public interest rates in the euro zone will remain above those of the United States and the United Kingdom (see the figure), even though the average budget deficit was considerably lower

in 2011 in the euro zone than in these two countries: 3.6% against 9.7% in the US and 8.3% in the UK.

To pull out of this recessionary spiral, the euro zone countries need to recognize that austerity is not the only way to reduce budget deficits. Growth and the level of interest rates are two other factors that are equally important for ensuring the sustainability of the public debt. It is therefore urgent to set out a different strategy, one that is less costly in terms of growth and employment, which is the only way to guarantee against the risk that the euro zone could fall apart. First, generalized austerity should be abandoned. The main problem with the euro zone is not debt but growth and unemployment. Solidarity must be strengthened to curb speculation on the debt of the weaker countries. The fiscal policies of the Member states also need to be better coordinated in order to mitigate the indirect effects of cutbacks by some on the growth of others [1]. It is necessary to stagger fiscal consolidation over time whenever the latter is needed to ensure debt sustainability. At the same time, countries with room for fiscal manoeuvre should develop more expansionary fiscal policies. Finally, the activities of the European Central Bank should be strengthened and coordinated with those of the euro zone governments. The ECB alone has the means to anchor short-term and long-term interest rates at a sufficiently low level to make it possible both to support growth and to facilitate the refinancing of budget deficits. In two exceptional refinancing operations, the ECB has provided more than 1,000 billion euros for refinancing the euro zone banks. This infusion of liquidity was essential to meet the banks' difficulties in finding financing on the market. It also demonstrates the capacity for action by the monetary authorities. The portfolio of government debt securities held by the ECB at end March 2012 came to 214 billion euros, or 2.3% of euro zone GDP. In comparison, in the United States and the United Kingdom, the portfolio of government securities held by the central banks represents

more than 10% of their GDP. The ECB therefore has significant room for manoeuvre to reduce the risk premium on euro zone interest rates by buying government securities in the secondary markets. Such measures would make it possible to lower the cost of ensuring the sustainability of the long-term debt.

[1] See “He who sows austerity reaps recession”, [OFCE note no. 16](#), March 2012.

Europe’s banks: leaving the zone of turbulence?

By [Vincent Touzé](#)

The 2008 crisis almost endangered the entire global financial

system. Thanks to support from governments and central banks, the banking sector has recovered and once again appears to be solid financially. In the aftermath of the crisis, the public finances of the Southern euro zone countries – Portugal, Italy, Spain and Greece – and Ireland (the “PIIGS”) have, in turn, been severely weakened. Greece was forced to suspend payments, and the risk of default is still hanging over the others. Since early 2011, bank liabilities in these economies have become a significant concern of the financial markets. Despite good stress tests, this fear intensified in August 2011. European banks then entered a new period of turmoil, and the European Central Bank was forced to lend them more than 1,000 billion euros for 3 years at a rate of 1% in order to avoid a major credit crunch.

As part of their investments abroad and through their foreign branches, Europe’s banks hold liabilities from the PIIGS countries through lending to the banking sector, to the public sector (sovereign debts and credits) and to households and private non-bank enterprises. France is one of the countries that is most heavily exposed to the PIIGS (public and private sectors combined), with a total commitment by the banking system in the third quarter of 2011 of about 437 billion euros (see table), or 21.9% of GDP. Germany’s exposure, at about 322 billion euros (12.5% of GDP), is smaller. The exposure of the UK banking system is comparable and is valued at 230 billion euros, or 13.3% of GDP. In comparison, the Japanese and US banks hold little debt: 59 billion euros (1.4% of GDP) for Japan and 96 billion (0.9% of GDP) for the United States. In the course of the financial crisis, Europe’s banks have pulled back from these countries (1). According to the statistics of the Bank for International Settlements (Figure 1), the reduction in exposure was most pronounced in Greece (-55% since Q1 2007) and lowest in Portugal (-15%). Divestments of the debt of Spain (-29%), Italy (-33%) and Ireland (39%) have been comparable and are at an intermediate level compared to the previous two.

Guarantee funds can be drawn on if a bank goes bankrupt, but generally their provisions are insufficient to support a "big" bank in difficulty. According to the principle of "too big to fail", the state must intervene to avoid bankruptcy. Possible avenues of action include acquiring some of the bank's capital, nationalizing it by refloating it, or facilitating its long-term refinancing through the purchase of bonds. A bank failure has to be avoided at all costs, because it is frequently accompanied by panic, with collateral damage that is difficult to predict or contain. The mere fact that a State announces credible support for a bank or a banking system is often sufficient to avert a panic. If the States were to come to the rescue of the banks in the case of the Greek default, the macroeconomic implications of a 50% default on all private and public debts seem relatively minor, since it would require, for example in the case of France, a cost of around 17 billion euros, an amount that is much less than 1% of GDP (see table). By contrast, a 50% default of all the PIIGS would require 220 billion euros in support from France (11% of French GDP). The macroeconomic cost beforehand might seem high, but it is not insurmountable. Unfortunately, the spontaneous failure of one or more PIIGS would lead to an uncontrollable chain reaction whose overall macroeconomic costs could be considerable.

This financial crisis is also hitting the life insurance companies, right in the midst of a period of reform in prudential regulations. The banking sector has just managed to come up to Basel II standards and will steadily have (until 2019) to adopt Basel III (2), while the insurance industry is changing rapidly towards Solvency II (3). These two regulatory reforms are leading to an increasing need for capital just as the financial crisis is undermining balance sheets and putting greater pressure on capital ratios. While equity capital can be used to withstand a financial crisis, at the same time regulations can compel recapitalizations in very difficult refinancing conditions. This is an undesirable pro-cyclical

result of the prudential regulations.

The risk of a default on payments by some PIIGS has made financial analysts pay particularly close attention to the solvency and profitability of European banks. However, the results of the stress tests (4) on the European banks published in mid-July 2011 were considered good. The hypotheses used are far from being optimistic. In the euro zone (and respectively in the other countries), they point to a fall in the growth rate of 2 points (2.4 points respectively) in 2011 and 2 points (1.9 points respectively) in 2012 compared to a reference scenario. In the euro zone, this entry into recession (-0.5% in 2011 and -0.2% in 2012) would be accompanied by higher unemployment (0.3 point in 2011 and 1.2 points in 2012), a lower inflation rate (-0.5 point in 2011 and -1.1 points in 2012), a sharp drop in property prices, a rise in long-term rates as well as discounts on sovereign debt (5) of up to 30%. The objective of this "stressed" scenario is to test the capacity of the banks to be able to maintain a "core Tier 1" ratio greater than 5% (6). Under these extreme assumptions, only 8.9% of the 90 banks tested achieved a ratio that was below the 5% ceiling that would trigger a de facto recapitalization to meet the target (7). The four French banks succeeded on the stress tests without difficulty, as they maintain high ratios: 6.6% for Societe Generale, 6.8% for the Banque populaire-Caisse d'épargne, 7.9% for BNP Paribas and 8.5% for Crédit Agricole. The countries where failures were observed include Austria (1 bank), Spain (5 failures) and Greece (2 failures). In view of the stress tests, the European banking system could therefore be considered as capable of withstanding a major economic crisis.

After the second aid package to Greece on 21 July 2011, and with ongoing pressure on the other sovereign debts, worry seized the stock markets, and European bank stocks fell sharply from August to December 2011 (Figure 2). These stock

market changes were in complete contradiction with the positive results of the stress tests. There are three possible ways to interpret the reaction of the financial markets:

- An actual crisis would be much sharper than the hypotheses of the stress tests;
- The stress test methods are not adequate for estimating the consequences of a crisis;
- The markets get swept up in the slightest rumors and are disconnected from basics.

For now, with respect to the most pessimistic forecasts, it does not seem that the stress test hypotheses are particularly favorable. However, they have weaknesses for assessing systemic financial crisis, in that each bank does not include in its assessment the damage brought about by the application of the scenario to other banks or the consequences for the credit market. There is no feedback from the financial interconnections. Moreover, the economic crisis can greatly increase the default rates of private companies. This point may have been underestimated by the stress tests. Note also that the tests are performed at an internal level, which can also lead to different assessments of the consequences of certain scenarios. In addition, the stress tests evaluate the financial soundness of the banks, but de facto, a bank, although solvent, can see its stock price fall in times of crisis for the simple reason that its expected profitability decreases. Most importantly, the runaway financial markets are due to the lack of a consensus on the decisions taken within the European Union on finding a definitive solution to the debt crisis but also to the fact that the statutes of the European Central Bank prohibit it from participating in public debt issues. These uncertainties reinforce the volatility of the stock price of banks that are particularly exposed to PIIGS, as evidenced by the strong correlation between CDS on private banks and on sovereign debt in the euro zone (8).

With the beginning of a solution on Greek debt, the stock market listings of European banks have been rising since

January 2012. Hopefully the agreement of 21 February 2012 on Greek sovereign debt will calm the storm that hit the bond markets. The operation provides that private investors agree to give up 107 billion euros of the 206 billion of debt they hold and that the euro zone States agree a new loan of 130 billion. The agreement is a swap of debt. The old bonds are exchanged against new ones at a discount of 53.5% of the face value (9) and at a new contractual interest rate. The write-down was not a surprise for the banks, which have already set aside provisions for the losses. The operation was a clear success (10), as 83% of the holdings were voluntarily offered for exchange on 9 March (11). The level of participation was increased to more than 95% by carrying through a compulsory exchange with creditors who had not responded positively to the operation (collective action clauses for debt held under Greek law). After this exchange, the European states, the IMF, and the ECB will hold "more than three-quarters of Greek debt" (12), which means that any new crisis of Greek sovereign debt would have little impact on private investors. A new source of uncertainty comes from the CDS that were taken out for the purpose of hedging or speculation ("naked CDS"). Initially, the International Swaps and Derivatives Association (ISDA) (13) announced on 1 March that this exchange was not a "credit event". On 9 March, it revised its judgment (14). The ISDA now believes that the collective action clauses are forcing owners to accept the exchange, which constitutes a credit event. The Greek default on payments is a legally recognized event, and the CDS are thus activated. According to the ISDA, the net exposure of CDS to Greece would amount to only 3.2 billion dollars. To estimate the overall cost of the CDS for the financial sector, the residual value of the bonds would have to be subtracted from that amount. Given the inability of Greece to resume growth, the sustainability of its remaining debt is not guaranteed, and the risk of contagion persists. In any event, the public debt of the Southern euro zone countries and Ireland are now considered risky assets, which is a factor that is weakening the European banking sector. In this

respect, since late March the recent rise in interest rates on Italian and Spanish public debt has provoked a decline in the stock prices of European banks (Figure 2).

The ongoing financial crisis is weakening the banking sector in the euro zone, which could lead it to reduce its exposure to risk: a major credit crunch is thus to be feared. The latest ECB survey covering 9 December 2011 to 9 January 2012 (15) with regard to the lending conditions set by banks is not very reassuring. Tighter conditions are expected by 35% (against 16% last quarter) of banks on business loans and by 29% (against 18% last quarter) of banks on consumer loans. In light of this prospect, on 21 December 2011 the ECB conducted a long-term refinancing operation. This was a huge success, with 489 billion euros in credits granted to the banking sector. The funds were loaned at 1% for a period of 3 years. Although it is still difficult to assess the impact of this measure, ECB president Mario Draghi said in February that this injection of liquidity had clearly avoided a major credit crunch. On 29 February 2012, the ECB launched a second long-term refinancing plan (16). The subscription was very substantial, with 530 billion euros disbursed. It is therefore reasonable to think that a credit crunch will be avoided.

In conclusion, the banking sector's escape from the zone of turbulence depends on four key factors:

- 1) Only a long-term return to growth across the euro zone as a whole will make it possible to consolidate the public purse and reduce the number of business failures (17), thereby de facto reducing banks' exposure to the risk of default, with responsibility incumbent on the European governments and the ECB to identify and implement the "right" policy mix and the appropriate structural measures.

- 2) The Greek State is insolvent; this failure in public finances must not be allowed to spread to other economies, since the banking crisis is also a test of the strength of financial solidarity in the euro zone, and it remains to be

seen whether the Germans are more inclined to support Spain or Italy in case of a risk of default than they were with Greece.

3) The banking crisis has brought to the fore the procyclical effects of the prudential regulations, which need to be corrected.

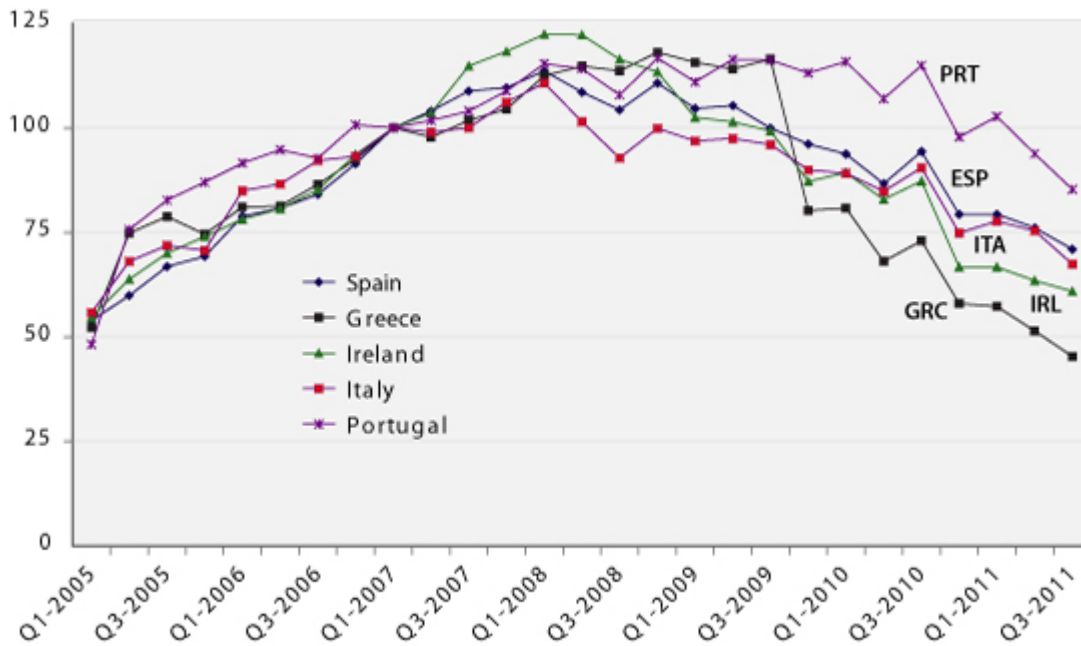

4) The maneuvering room of governments as first responders in a crisis has become very limited due to their massive debt. If there is a new major shock, the ECB could have no other choice but to be the lender of last resort.

Towards a major tax reform?

By [Guillaume Allègre](#) and [Mathieu Plane](#) (eds.)

Taxation is more at the heart of the current election campaign and public debate than ever before. The economic and financial crisis, coupled with the goal of rapidly reducing the deficit, is inevitably shaking up the electoral discourse and forcing us to confront the complexity of our tax system. How do taxes interact with each other? What are the effects? How are they measured? What kind of consensual basis and constraints does taxation require? How should the tax burden be distributed among the economic actors? How should social welfare be financed? Should we advocate a “tax revolution” or incremental reform? The contributions to [a special “Tax Reform” issue of the Revue de l’OFCE – Débats et Politiques](#) aim to clarify and enrich this discussion.

The first section of the special issue deals with the requirements and principles of a tax system. In an introductory article, [Jacques Le Cacheux](#) considers the main principles that should underpin any necessary tax reform from the viewpoint of economic theory. In a historical analysis, [Nicolas Delalande](#) emphasizes the role of political resources, institutional constraints and social compromises in drawing up tax policy. [Mathieu Plane](#) considers past trends in taxation from a budgetary framework and analyzes the constraints on public finances today. In response to the problem of imported carbon emissions, [Eloi Laurent and Jacques Le Cacheux](#) propose the implementation of a carbon-added tax.

The second section deals with the issue of how the tax burden

is distributed among households. [Camille Landais, Thomas Piketty and Emmanuel Saez](#) respond to the important article by [Henri Sterdyniak](#) in which he recommends a “tax revolution”. [Clément Schaff and Mahdi Ben Jelloul](#) propose a complete overhaul of family policy. [Guillaume Allègre](#) attempts to shed light on the debate over France’s “family quotient” policy. Finally, [Guillaume Allègre, Mathieu Plane and Xavier Timbeau](#) propose a reform of taxation on wealth.

The third section concerns the financing of social protection. In a sweeping review of the literature, [Mireille Elbaum](#) examines changes in the financing of social protection since the early 1980s, and considers the alternatives that have been proposed and their limits. [Eric Heyer, Mathieu Plane and Xavier Timbeau](#) analyze the impact of the implementation of the “quasi-social VAT” approved by the French Parliament. [Frédéric Gannon and Vincent Touzé](#) present an estimate of the marginal tax rate implicit in the country’s pension system.

Must balancing the public finances be the main goal of economic policy

By [Henri Sterdyniak](#)

The financial crisis of 2007-2012 caused a sharp rise in public deficits and debt as States had to intervene to save the financial system and support economic activity, and especially as they experienced a steep drop in tax revenues due to falling GDP. In early 2012, at a time when they are far from having recovered from the effects of the crisis (which cost them an average of 8 GDP points compared to the pre-

crisis trend), they face a difficult choice: should they continue to support activity, or do whatever it takes to reduce public deficits and debt?

[An in-depth note expands on nine analytical points:](#)

– The growth of debt and deficits is not peculiar to France; it occurred in all the developed countries.

– France's public bodies are certainly indebted, but they also have physical assets. Overall the net wealth of government represented 26.7% of GDP in late 2010, or 8000 euros per capita. Moreover, when all the national wealth is taken into account (physical assets less foreign debt), then every French newborn has an average worth at birth of 202 000 euros (national wealth divided by the number of inhabitants).

– In 2010, the net debt burden came to 2.3% of GDP, reflecting an average interest rate on the debt of 3.0%, which is well below the nominal potential growth rate. At this level, the real cost of the debt, that is, the primary surplus needed to stabilize the debt, is zero or even slightly negative.

– The true “golden rule” of public finances stipulates that it is legitimate to finance public investment by public borrowing. The structural deficit must thus be equal to the net public investment. For France, this rule permits a deficit of around 2.4% of GDP. There is no reason to set a standard for balancing the public finances. The State is not a household. It is immortal, and can thus run a permanent debt: the State does not have to repay its debt, but only to guarantee that it will always service it.

– The public deficit is detrimental to future generations whenever it becomes destabilizing due to an excessive increase in public spending or an excessive decrease in taxation, at which point it causes a rise in inflation and interest rates and undermines investment and growth. This is not the situation of the current deficit, which is aimed at making

adjustments to provide the necessary support for economic activity in a situation of low interest rates, due to the high level of household savings and the refusal of business to invest more.

– For some, the 8 GDP points lost during the crisis have been lost forever; we must resign ourselves to persistently high unemployment, as it is structural in nature. Since the goal must be to balance the structural public balance, France needs to make an additional major effort of around 4 percentage points of GDP of its deficit. For us, a sustainable deficit is about 2.4 GDP points. The structural deficit in 2011 is already below that figure. It is growth that should make it possible to reduce the current deficit. No additional fiscal effort is needed.

– On 9 December 2011, the euro zone countries agreed on a new fiscal pact: the Treaty on Stability, Coordination and Governance of the European Monetary Union. This Pact will place strong constraints on future fiscal policy. The structural deficit of each member country must be less than 0.5% of GDP. An automatic correction mechanism is to be triggered if this threshold is exceeded. This constraint and the overall mechanism must be integrated in a binding and permanent manner into the fiscal procedures of each country. Countries whose debt exceeds 60% of GDP will have to reduce their debt ratio by at least one-twentieth of the excess every year.

This project is economically dangerous. It imposes medium-term objectives (a balanced budget, a debt rolled back to below 60% of GDP) that are arbitrary and are not *a priori* compatible with the necessities of an economic equilibrium. Likewise, it imposes a fiscal policy that is incompatible with the necessities of short-term economic management. It prohibits any discretionary fiscal policy. It deprives governments of any fiscal policy instrument.

– As the rise in public debts and deficits in the developed countries came in response to mounting global imbalances, we cannot reduce the debts and deficits without addressing the causes of these imbalances. Otherwise, the simultaneous implementation of restrictive fiscal policies in the OECD countries as a whole will lead to stagnating production, falling tax revenues and deteriorating debt ratios, without managing to reassure the financial markets.

– A more balanced global economy would require that the countries in surplus base their growth on domestic demand and that their capital assumes the risks associated with direct investment. In the Anglo-American world, higher growth in wage and social income and a reduction in income inequalities would undercut the need for swelling financial bubbles, household debt and public debt. The euro zone needs to find the 8 GDP points lost to the crisis. Instead of focussing on government balances, the European authorities should come up with a strategy to end the crisis, based on a recovery in demand, and in particular on investment to prepare for the ecological transition. This strategy must include keeping interest rates low and public deficits at the levels needed to support activity.

The new European treaty, the euro and sovereignty

By [Christophe Blot](#)

On 2 March 2012, 25 countries in the Economic and Monetary Union (EMU) adopted a new treaty providing for greater fiscal discipline. The treaty became an object of dispute almost before the ink was dry [1], as Francois Hollande announced that, if elected, he would seek to renegotiate it in order to emphasize the need to address growth. There is no doubt that a turnabout like this on a treaty that was so fiercely negotiated would be frowned upon by a number of our European partners. The merit of strengthening fiscal discipline in a time of crisis is, nevertheless, an issue worth posing.

So how should we look at this new treaty? Jérôme Creel, Paul Hubert and Francesco Saraceno have already demonstrated [the potential recessionary impact of the rules it introduces](#). In addition to these macroeconomic effects, the treaty also fails to deal with an essential question that should be at the heart of the European project: sovereignty.

In 1998, one year before the launch of the euro, Charles Goodhart [2] published an article in which he raised a peculiar feature of the Economic and Monetary Union (EMU) with respect to monetary theory and history. Goodhart recalled that a currency is almost always inextricably bound up with the expression of political and fiscal sovereignty. However, in the context of the EMU, this link is broken, as the euro and monetary policy are controlled by a supranational institution even though they are not part of any expression of European sovereignty, as fiscal policy decisions in particular remain decentralized and regulated by the Stability and Growth Pact. Goodhart concluded that the creation of the euro portends tensions that will need careful attention.

The current crisis in the euro zone shows that this warning was well founded. The warning makes it possible above all to consider the crisis from a different perspective – a political one. The issue of the sustainability of the debt and compliance with rules in effect masks the euro's underlying problem, its "original sin": the single currency is doomed if it is not based on fiscal and political sovereignty. If there are any exceptions to this, they consist of micro-states that have abandoned their monetary sovereignty to neighbours that are far more powerful economically and politically. The euro zone is not the Vatican.

The renegotiation of the treaty or the opening of new negotiations with a view to the ratification of a European Constitution is not only urgent but vital to the survival of the European project. Beyond the overarching objectives of growth, employment, financial stability and sustainable development, which, it must be kept in mind, are at the heart of European construction, as is evidenced by their inclusion in Article 3 of the [Treaty on the European Union](#), any new negotiations should now address the question of Europe's political and fiscal sovereignty, and therefore, by corollary, the issue of the transfer of national sovereignty.

It should be noted that this approach to the implementation of European sovereignty is not inconsistent with the existence of rules. In the United States, most states have had balanced budget rules since the mid-nineteenth century, prior to which a number of them had defaulted (see C.R. Henning and M. Kessler [3]). However, these rules were adopted at the initiative of the states and are not included in the US Constitution. There are, however, ongoing efforts to include a requirement in the Constitution for a balanced budget at the federal level. [For the moment, these have not been successful, and they are being challenged](#) on the grounds that this would risk undermining the stabilizing power of the federal budget. In the United States, before the crisis the resources of the

federal state accounted for 19% of GDP, compared with an EU budget that does not exceed 1% of GDP and which must always be balanced, and therefore cannot be used for of macroeconomic adjustments. In the US, the stabilization of shocks is thus handled through an unrestricted federal budget, which offsets the poor responsiveness of local fiscal policies that are constrained by the requirement for balance. While the euro zone must surely find its own way, the fact remains that the euro should not be an instrument in the hands of the European Central Bank alone: it must become a symbol of the political and fiscal sovereignty of all the euro zone's citizens.

[1] It will only take effect, however, after a ratification process in the 25 countries. This could be a long and uncertain process, as Ireland has announced that it will hold a referendum.

The citizen must be the

foundation of any industrial policy – even a free market one

By [Sarah Guillou](#)

The purpose of industrial policy is to direct productive specialization towards sectors that are deemed strategic for well-being or economic growth. This means recognizing that productive specialization is important for growth. But what criteria should be used to determine the importance of a given sector? The argument developed here is that there are no sound criteria that do not refer to the collective preferences of present and future citizens.

There are a limited number of theoretical principles for justifying an industrial policy and demonstrating its effectiveness. From the defence of nascent industries (List, 1841) to support for basic industries that generate externalities for growth, the theoretical arguments set out very limited conditions for the exercise of policy. The international legal framework is also very stringent, especially for European Union countries whose authorities are concerned primarily with creating a level playing field for all EU companies and keeping control over payments by the State.

The limited space for industrial policy

In this limited space, the exercise of industrial policy has struggled to find reasons to exist. Even though a movement of “normalization”, dear to Dani Rodrik, currently seems to be affecting the study of industrial policy (see Aghion et al., 2011), it is still not part of “normal” policy in the same way as monetary, fiscal, or trade policy, for example. Industrial policy is exceptional policy resulting from exceptional

circumstances. It is in the definition of this term “exceptional”, of its nature and its temporality, that industrial policy derives its legitimacy. Even recently, exceptional circumstances, both political and economic, have served as strong grounds for industrial policy, whereas they actually conceal policies to promote employment and satisfy electoral objectives. Illustrations of this include businesses set up to rescue factories, from Lejaby lingerie units to SeaFrance, as well as announcements of regulations on plant closures when a buyer exists. Even though these interventions have the benefit of reducing information asymmetries between the players by offering mediation that is often useful, they are not really part of industrial policy.

The only “authorized” industrial policy today that is consistent with the institutional and legal framework of Europe and America is one that meets the conditions inherited from liberal doctrine on state intervention in the functioning of the economy. One may wish that the rules on intervention were re-defined – which by the way, would bring a little more transparency into state practices – but the ambition of this note is both more modest and broader. This note aims to show that, even within the minimalist framework of the free market approach, industrial policy must be defined in accordance with a social project that engages the productive specialization of the economy.

As a general principle, liberal doctrine considers competition to be the most efficient process for allocating resources. In other words, competition is the best system for maximizing wealth creation. Indeed, it is supposed to foster emulation between the players and motivate them to increase their productivity and performance; to allow the eviction of inefficient activities that waste poorly exploited resources; and, finally, to ensure equality and freedom among the players with respect to market entry, and thus the free exercise of economic activity. Liberal economic theory thus envisages only

very specific situations for the exercise of industrial policy.

In this framework, state intervention is justified (i) to restore competitive conditions concerning transparency of information; (ii) to support investment in activities that generate positive externalities, such as R&D, or conversely to discourage activities that generate negative externalities, such as pollution, and (iii) to support activities that are considered strategic. Note that these are precisely the three justifications that underpin the European Union's policy on industry and competition. It should be noted above all that while the last two reasons do indeed call for an industrial policy, they demand a higher principle of a political nature that invokes the collective preferences of present and future generations.

Encouraging the externalities that arise from R&D spending does not of course necessarily reflect a political choice. Indeed, the underlying economic logic might be sufficient: the externalities from R&D include a boost in productivity induced by the diffusion of knowledge, which benefits society as a whole. This increased productivity provides additional growth that fuels the creation of jobs and wealth. It is indeed this economic dynamic that is emphasized by the European authorities, including the European Commission (see Buch-Hansen and Wigger, 2010; EC, 2011), just as it underpins American policy on subsidies for R&D (Ketels, 2007). The policy decision to support R&D and more generally investment in human capital can thus be based simply on economic logic.

Any policy that is intended to guide specialization involves society's future

Nevertheless, this logic is not enough: once we have accepted that investment in R&D is needed, then it is necessary to decide how to ensure that public resources, which are scarce and whose opportunity cost is rising as debt mounts, are

invested in the wisest way. The definition of industrial policy must be based on a set of political (and legal) guidelines that are precise enough to lead business to invest in technology whose returns are inherently uncertain. For example, companies do not spontaneously tend to invest in clean technologies. Incentives need to be created that induce them to adopt sustainable development pathways, as is shown by the results of Acemoglu et al. (2011).

In general, any policy that aims to guide specialization involves the future of society: directing the production process towards sustainable development and environmental protection is a decision that will ensure the sustainability of resources, the quality of life and technological innovation. Directing capital towards strategic technologies, such as biotechnology, nanotechnology or space, is a necessity in light of the heavy investments – the fixed costs – that are associated with their development, given that mastering these technologies is essential to society's future well-being. Finally, investing in human capital, a prerequisite to any policy to support R&D, is a way not only to improve people's living standards and quality of life and to qualitatively strengthen their ability to adapt to technological change, but also to ensure the strength and sustainability of democracy (Glaeser et al., 2007).

A commitment to a policy of support for investment in research and education is of course widely shared by political leaders, as it is a general feature of a progressive vision of society, or, in short, a certain vision of social welfare. And a package of measures to meet the objectives of a policy to support R&D in France does clearly exist: the research tax credit for the country's "competitive clusters"; in this respect, France is often seen as a driving force in terms of its industrial policies. But the purpose evoked to justify these measures is to ensure competitiveness, and not specifically economic growth *per se*.

Nevertheless, the selection of promising technologies and investment in the specializations of the future demands that politics takes precedence, as it must take a stand on the technological future of society, including in matters of protection, security, health and the environment. Ultimately, even a free market industrial policy assumes political choices that correspond to a vision of society. And it is in the name of this social vision that the expenditure associated with industrial policy can be justified. The justifications related to the economic mechanisms set the constraints, but policy choices must set the goals. The expression of collective preferences during the forthcoming electoral processes requires that the technological implications of policy proposals be expressed as clearly as possible.

Is government expenditure in France too high?

By [Xavier Timbeau](#)

Since 2005, France has vied with Denmark for first place in terms of government expenditure as reported by the OECD. Since the ratio of "government expenditure" to GDP reached 56.6% in 2010, it has been necessary, according to a widely held view, to "deflate" a State that is taking up "too much" space in the economy. First place would thus be, not a badge of honour, but a sign that we have reached an unsustainable level of "government expenditure". Since, moreover, it is essential to reduce the public deficit, the path ahead is clear: reducing public spending is the only way to bring public finances under control. But this simplistic analysis is wrong.

This analysis is based on a poor use of the statistics on [government expenditure reported by the OECD](#) and flows from an

inadequate understanding of what the term "government expenditure" means. This term, it must be recognized, can be confusing.

What is called "government expenditure" combines, on the one hand, collective expenditures (e.g. from maintenance of the security forces to public administration and the fight against poverty) and, on the other, insurance-related transfer expenditures. This transfer spending covers pension insurance and health insurance. These are individualizable in the sense that we know the direct beneficiary of the expense (which is not the case for administrative expenditures, for which the benefits are diffuse), and they are funded by contributory schemes: to qualify for coverage, it is necessary to have contributed. In most countries, the pension system is almost completely contributory, in the sense that the relative level of benefits for individuals of the same age is related to their relative contributions. The rate of return on the contributions (which relates the expected present value of the flow of pension benefits to the present value of the contributions) is comparable to that obtainable over a long period by capitalizing savings. The minimum pension payment, family benefits and survivor benefits might seem to deviate from this contributory principle, but in practice these "benefits" compensate for short careers that have been interrupted by the accidents of life and do not differ much from a contributory scheme. With regard to health, another pillar of the modern welfare State, the contributory aspect is mitigated by the redistribution effected by a contribution that is proportional to income and an expense that depends on age and not much on income (with the exception of daily allowances). When health care provision is universal, some people benefit without having contributed, but these cases are marginal and do not alter the quasi-contributory character of our health systems.

Depending on the country, the pooling of transfer expenditures

takes various organizational forms. It may be done inside the company, within sector-wide organizations, or by management and trade union bodies or it may be mediated by central government. The particularity of France is that social protection is mainly organized through the State's intermediation. This is not the case in other countries like the United Kingdom, the United States or Germany. Even unemployment insurance, which is handled by management/union bodies, is treated by the national accounts as pertaining to the public sector, and UI contributions are considered compulsory levies (automobile insurance premiums, although imposed on anyone who uses the roads, are not classed as levies).

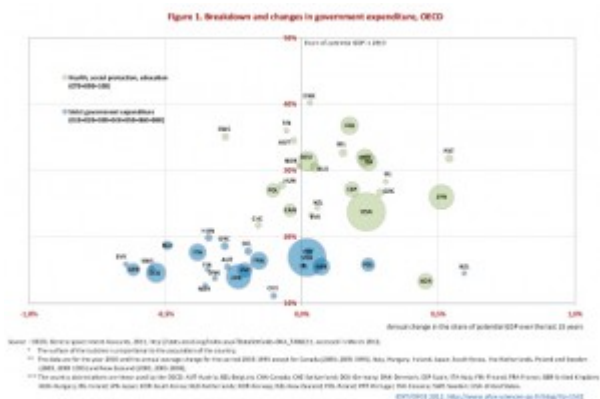

Figure 1 shows the unique position of France. In 2010, “government expenditure” in the strict sense (that is to say, not individualizable, such as domestic and foreign security, administration, miscellaneous expenditure on interventions) represented 18.2% of the country’s GDP. In terms of this “strict government expenditure”, in 2009 France ranked 10th among the OECD countries (see also Figure 2). If the “competition for being thin” covered only expenditure in this narrower sense, France would be relatively average compared to other bigger-spending countries like the United States, Portugal and Italy. Moreover, unlike the UK, the US or Ireland, over the last 20 years France has cut “strict government expenditure”, in a rather unexpected demonstration of fiscal control.

Figure 1 also shows that there is not great variation among the OECD countries with respect to the hard core of “government expenditure”. A developed country needs security, public administration and expenditure on interventions. It is difficult to compress this kind of State spending; the difference between the State with the largest expenditure (Hungary) and that with the smallest (Switzerland) is 8 GDP points. If we limit ourselves to large States, the gap is smaller (a difference of 3.6 GDP points between Japan and Italy). In contrast, with respect to “government social expenditure”, the differences between countries are major: the gap between Korea and Denmark is 27 GDP points, and, among the major countries, 13 GDP points between the United States and France. This makes France, along with Denmark, Sweden, Austria and Finland, a country where “government social expenditure” in relation to GDP is high.

Can we conclude from these data that the French system of social protection is more generous than in other countries? And that this is the cause of an unsustainable public debt (Figure 3)? Can we say that the system is too generous and that we must reverse the course of the past 20 years by reducing the share of social spending in GDP? No, the data tell us only one thing: that social welfare, health and education in France are dispensed directly by the State, which provides funding for these through the tax system. In other countries, intervention by the State (or by local authorities) may be just as massive (for instance, by defining

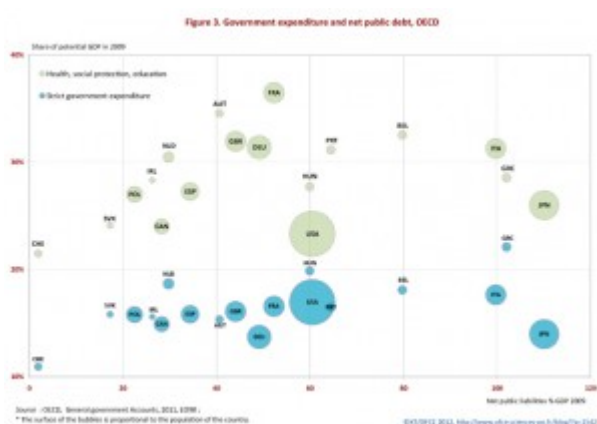

specifications for education, prices of treatments or medications, or obligations to take out health or retirement insurance), but the performance of the service or the distribution of the benefit may be delegated to a non-public entity. In some countries, only a portion of health or retirement coverage is mandatory, and individuals are then “free” to choose the level of spending they want. This freedom is relative, as people can be steered by tax incentives (instead of “government expenditure”, we speak of a “tax expenditure”, since it implies a shortfall in tax revenue for the State) or by necessity.

Total spending on health care and education is, for example, higher in the US than it is in France, relative to GDP, although the share directly distributed by the State is lower. How is it that expenditures deemed characteristic of a welfare State are higher in a more individualistic society? Are tax incentives and social norms being taken sufficiently into account? Another example: the introduction of the premium and the discount (*surcote* and *décote*) into the French pension system has changed individual incentives, and therefore individual returns (towards greater “actuarial neutrality”). But this did not affect the GDP share of “government expenditure” on pensions. In the future, the establishment of long-term care insurance may increase “government social expenditure” by a few GDP points. The right question is not the legal personality of the distributing entity, but rather, what are the incentives that individuals perceive, and what kind of inter- or intra-generational support will this long-term care insurance involve.

A social system must be judged on the rights it confers and the duties it entails, and thus on the extent to which it is more contributory or more solidarity-oriented and redistributive. To this end, we need to look at the benefits and the levies, as well as the implicit or explicit guarantees given in case of a shock to the private or public institutions

that provide the benefits. A private system can be very redistributive (when the pricing of certain risks is prohibited, when there is a full State guarantee), and a public system can be very contributory and more neutral from an intergenerational perspective than a private system, as illustrated by Swedish pensions.

A simple review of the aggregate data is not enough to settle this debate, which is why the argument that cutting “government social expenditure” on the grounds that it is higher than in any other country simply makes no sense.
