

Euro zone: Recovery or deflation?

By [Céline Antonin](#), [Christophe Blot](#), Sabine Le Bayon and Danielle Schweisguth

This text summarizes the [OFCE's forecast for 2014-2015 for the euro zone economy](#)

Will the euro zone embark on the road to recovery, or will it sink into a deflationary spiral? The latest macroeconomic indicators are sending out conflicting signals. A return to growth is being confirmed, with three consecutive quarters of rising GDP. However, the level of unemployment in the euro zone remains at a historically high level (11.9% for the month of February 2014), which is fuelling deflationary pressures, as is confirmed by the latest figures on inflation (0.5% yoy for March 2014). While this reduction in inflation is partly due to changes in energy prices, the fact remains that underlying inflation has fallen under 1% (Figure 1). In these conditions, a turnaround in inflationary expectations cannot be excluded, which would undoubtedly push the euro zone into deflation. The ECB has been concerned about this situation for several weeks and says it is ready to act (see [here](#)). However, no concrete proposal for a way to ease monetary policy and ensure that expectations are not anchored on a deflationary trajectory has been set out.

After a fall in GDP of 0.4% in 2013, the euro zone will return to positive growth: 1.3% in 2014 and 1.6% in 2015. Even so, at this rate of growth, there will still be an open output gap in most of the euro zone countries, reflecting the idea that the euro zone is only slowly pulling out of the crisis. Indeed, although efforts to reduce deficits will be curtailed, fiscal policies will still be pro-cyclical. Furthermore, financing conditions will continue to improve. The end of the sovereign

debt crisis, thanks in particular to the announcements by the ECB in July and September 2012 [\[1\]](#), has reduced the risk premiums on the market for government bonds. The impact of lower long-term market rates has been partly reflected in bank interest rates, and credit supply conditions are generally less restrictive than they were between early 2012 and mid-2013. But there will still not be sufficient growth to trigger a recovery strong enough to lead to a rapid and significant reduction in unemployment. Indeed, the level will fall only very moderately, from 11.9% in the first quarter of 2014 to 11.3% at year end 2015. While Germany will enjoy almost full employment, mass joblessness in Spain and the other countries of southern Europe will persist (Figure 2). Unemployment should stabilize in Italy and continue to grow in France.

However, this continuing underemployment is giving rise to the risk of deflation. It is holding back growth in wages and contributing to the weakness of underlying inflation, which was in fact zero in Spain in March 2013 and negative in Greece and Portugal. For the euro zone as a whole, we do not expect deflation in the short term, but the weakness of growth is increasing the likelihood that private agents' expectations are not anchored in a deflationary scenario.

The situation in the euro zone is reminiscent of Japan in the 2000s. The country began to experience deflation in 1999 [\[2\]](#) following the recession associated with the Asian crisis. At that point, despite average growth of 1.4% between 2000 and 2006, prices failed to pick up, and the country's central bank did not find a way out of this trap, despite trying expansionary monetary policies. This is precisely the dynamic threatening the euro zone today, making it crucial to use all possible means to avoid this (monetary policy, fiscal policy and the coordination of wage policy [\[3\]](#)).

Figure 1. Unemployment rate and inflation rate in the euro zone

Source : Eurostat.

Figure 2. Unemployment in the euro zone countries

Note : The other southern countries are Portugal and Greece. The other northern countries are the Netherlands, Belgium, Ireland, Austria and Finland.

Sources : Eurostat, OFCE forecast April 2014.

[1] In July, ECB President Mario Draghi declared that the central bank would save the euro “whatever it takes”. In

September, the ECB announced the creation of a new mechanism called Outright Monetary Transactions (see the post by [Jérôme Creel and Xavier Timbeau](#)), which enables it to engage in unlimited purchases of sovereign debt.

[2] It should be pointed out that there was an initial period of deflation in 1995 following three years of economic stagnation.

[3] All these elements are discussed in detail in the previous [iAGS](#) report (2014).

The euro zone quartered

By [Céline Antonin](#), [Christophe Blot](#), Sabine Le Bayon and Danielle Schweisguth

This text summarizes the [OFCE's 2013-2014 forecast for the euro zone economy](#).

After six quarters of decline, GDP in the euro zone has started to grow again in the second quarter of 2013. This upturn in activity is a positive signal that is also being corroborated by business surveys. It shows that the euro zone is no longer sinking into the depths of depression. It would nevertheless be premature to conclude that a recovery is underway, as the level of quarterly growth (0.3%) is insufficient to cause any significant reduction in unemployment. In October 2013, the unemployment rate stabilized at 12% of the workforce, a record high. Above all, the crisis is leaving scars and creating new imbalances (unemployment, job insecurity and wage deflation) that will act as obstacles to future growth, especially in certain euro zone countries.

Several factors point towards a pick-up in economic activity that can be expected to continue over the coming quarters. Long-term sovereign interest rates have fallen, particularly in Spain and Italy. This reflects that the threat of a breakup of the euro zone is fading, which is due in part to the conditional support announced by the ECB a little over a year ago (see [Friends of acronyms: here comes the OMT](#)). Above all, there should be an easing of fiscal austerity, given that the European Commission has granted additional time to several countries, including France, Spain and the Netherlands, to deal with their budget deficits (see [here](#) for a summary of the recommendations made by the European Commission). Driven by the same mechanisms that we have already described in our previous forecasts, a little higher growth should follow this easing of austerity (-0.4 GDP point of fiscal effort in 2013, down from -0.9 point in 2013 and -1.8 in 2012). After two years of recession in 2012 and 2013, growth is expected to come to 1.1% in 2014.

Nevertheless, this growth will not be sufficient to erase the traces left by the widespread austerity measures implemented since 2011, which pushed the euro zone into a new recession. In particular, employment prospects are improving only very slowly because growth is too weak. Since 2008, the euro zone has destroyed 5.5 million jobs, and we do not expect a strong recovery in net job creation. Unemployment could fall in some countries, but this would be due mainly to discouraged jobseekers withdrawing from the workforce. At the same time, less austerity does not mean that there will be no austerity. With the exception of Germany, fiscal consolidation efforts will continue in all the euro zone countries. And whether this is achieved through a reduction in public spending or an increase in the tax burden, households will bear the brunt of the adjustment. At the same time, the persistence of mass unemployment will continue to fuel the deflationary pressures already at work in Spain and Greece. The improved competitiveness that results in these countries will boost

exports, but at the expense of increasingly undermining domestic demand. The impoverishment of the countries of southern Europe is going to be aggravated. Growth in these countries in 2014 will again be lower than in Germany, Austria, Finland and France (Table).

As a consequence, the euro zone will be marked by increasing heterogeneity, which could wind up solidifying public opinion in different countries against the European project and making the governance of the monetary union more difficult as national interests diverge.

Table. Growth in the euro zone

Austerity in Europe: a change of course?

By Marion Cochard and Danielle Schweisguth

On 29 May, the European Commission sent the members of the European Union its new economic policy recommendations. In

these recommendations, the Commission calls for postponing the date for achieving the public deficit goals of four euro zone countries (Spain, France, Netherlands and Portugal), leaving them more time to hit the 3% target. Italy is no longer in the excessive deficit procedure. Only Belgium is called on to intensify its efforts. Should this new roadmap be interpreted as a shift towards an easing of austerity policy in Europe? Can we expect a return to growth in the Old Continent?

These are not trivial matters. [An OFCE Note \(no. 29, 18 July 2013\)](#) attempts to answer this by simulating three scenarios for fiscal policy using the [iAGS model](#). It appears from this study that postponing the public deficit targets in the four euro zone countries does not reflect a real change of course for Europe's fiscal policy. The worst-case scenario, in which Spain and Portugal would have been subject to the same recipes as Greece, was, it is true, avoided. The Commission is implicitly agreeing to allow the automatic stabilizers to work when conditions deteriorate. However, for many countries, the recommendations with respect to budgetary efforts still go beyond what is required by the Treaties (an annual reduction in the structural deficit of 0.5 percent of GDP), with as a consequence an increase of 0.3 point in the unemployment rate in the euro zone between 2012 and 2017.

We believe, however, that a third way is possible. This would involve adopting a "fiscally serious" position in 2014 that does not call into question the sustainability of the public debt. The strategy would be to maintain a constant tax burden and to allow public spending to keep pace with potential growth. This amounts to maintaining a neutral fiscal stimulus between 2014 and 2017. In this scenario, the public deficit of the euro zone would improve by 2.4 GDP points between 2012 and 2017 and the trajectory in the public debt would be reversed starting in 2014. By 2030, the public deficit would be in surplus (0.7%) and debt would be close to 60% of GDP. Above all, this scenario would lower the unemployment rate

significantly by 2017. The European countries could perhaps learn from the wisdom of Jean de La Fontaine's fable of the tortoise and the hare: "*Rien ne sert de courir, il faut partir à point*", *i.e.* Slow and steady wins the race.

France: why such zeal?

By Marion Cochard and Danielle Schweisguth

On 29 May, the European Commission sent the members of the European Union its new economic policy recommendations. As part of this, the Commission granted France an additional two years to reach the deficit reduction target of 3%. This target is now set for 2015, and to achieve this the European Commission is calling for fiscal impulses of -1.3 GDP points in 2013 and -0.8 point in 2014 (see ["Austerity in Europe: a change of course?"](#)). This would ease the structural effort needed, since the implementation of the previous commitments would have required impulses of -2.1 and -1.3 GDP points for 2013 and 2014, respectively.

Despite this, the French government has chosen not to relax its austerity policy and is keeping in place all the measures announced in the draft Finance Act (PLF) of autumn 2012. The continuing austerity measures go well beyond the Commission's recommendations: a negative fiscal impulse of -1.8 GDP point, including a 1.4 percentage point increase in the tax burden for the year 2013 alone. Worse, the broad guidelines for the 2014 budget presented by the government to Parliament on 2 July 2013 point to a structural effort of 20 billion euros for 2014, *i.e.* one percentage point of GDP, whereas the Commission required only 0.8 point. The government is thus demanding an additional 0.6 GDP point fiscal cut, which it had already set

out in the multi-year spending program in the 2013 Finance Act.

The table below helps to provide an overview of the effort and of its impact on the French economy. It shows the trends in growth, in unemployment and in the government deficit in 2013 and 2014, according to three budget strategies:

1. One using the relaxation recommended by the Commission in May 2013;
2. One based on the budget approved by the government for 2013 and, *a priori*, for 2014;
3. One based on an alternative scenario that takes into account the negative 1.8 GDP point fiscal impulse for 2013 and calculates a fiscal impulse for 2014 that would be sufficient to meet the European Commission's public deficit target of -3.6%.

The different scenarios for deficit reduction in France

In %

	Relaxation (1)		Approved budget (2)		Alternative scenario (3)	
	2013	2014	2013	2014	2013	2014
Fiscal impulse	-1.3	-0.8	-1.8	-1.0	-1.8	-0.2
Unemployment rate	10.5	10.6	10.7	11.1	10.7	10.5
Growth	0.2	1.3	-0.2	1.0	-0.2	1.7
Public deficit	-4.3	-3.6	-3.9	-3.1	-3.9	-3.6

Source : Authors' calculations based on the iAGS model.

According to our estimates using the iAGS model [\[1\]](#), the public deficit would be cut to 3.1% of GDP in 2014 in scenario (2), whereas the Commission requires only 3.6%. As a consequence of this excess of zeal, the cumulative growth for 2013 and 2014 if the approved budget is applied would be 0.7 percentage point lower than growth in the other two scenarios (0.8 point against 1.5 points). The corollary is an increase in unemployment in 2013 and 2014: the unemployment rate, around 9.9% in 2012, would thus rise to 11.1% in 2014, an increase of more than 350,000 unemployed for the period. In contrast, the more relaxed scenario from the European

Commission would see a quasi-stabilization of unemployment in 2013, while the alternative scenario would make it possible to reverse the trend in unemployment in 2014.

While the failure of austerity policy in recent years seems to be gradually impinging on the position of the European Commission, the French government is persisting along its same old path. In the face of the social emergency that the country is facing and the paradigm shift that seems to be taking hold in most international institutions, the French government is choosing to stick to its 3% fetish.

[1] iAGS stands for the Independent Annual Growth Survey. This is a simplified model of the eleven main economies in the euro zone (Austria, Belgium, Finland, France, Germany, Greece, Ireland, Italy, Netherlands, Portugal and Spain). For more detail, see the working document [Model for euro area medium term projections](#).

The chalice of austerity, right to the dregs

[Céline Antonin](#), [Christophe Blot](#) and Danielle Schweisguth

[This text summarizes the OFCE's April 2013 forecasts](#)

The macroeconomic and social situation in the euro zone continues to cause concern. The year 2012 was marked by a further decline in GDP (-0.5%) and a continuing rise in the unemployment rate, which reached 11.8% in December. While this new recession is not comparable in magnitude to that of 2009,

it is comparable in duration, as GDP fell for the fifth consecutive time in the last quarter of 2012. Above all, for some countries (Spain, Greece and Portugal), this prolonged recession marks the beginning of deflation that could quickly spread to other countries in the euro zone (see [The onset of deflation](#)). Finally, this performance has demonstrated the failure of the macroeconomic strategy implemented in the euro zone since 2011. The strengthening of fiscal consolidation in 2012 did not restore market confidence, and interest rates did not fall except from the point when the risk of the euro zone's collapse was mitigated by the ratification of the Treaty of stability, coordination and governance (TSCG) and the announcement of the new WTO operation allowing the ECB to intervene in the sovereign debt markets. Despite this, the fiscal dogma has not been called into question, meaning that in 2013, and if necessary in 2014, the euro zone countries will continue their forced march to reduce their budget deficits and reach the symbolic threshold of 3% as fast as possible. The incessant media refrain that France will keep its commitment is the perfect reflection of this strategy, and of its absurdity (see [France: holding the required course](#)). So until the chalice has been drunk to the dregs, the euro zone countries seem condemned to a strategy that results in recession, unemployment, social despair and the risk of political turmoil. This represents a greater threat to the sustainability of the euro zone than the lack of fiscal credibility of one or another Member State. In 2013 and 2014, the fiscal stimulus in the euro zone will again be negative (-1.1% and -0.6%, respectively), bringing the cumulative tightening to 4.7 GDP points since 2011. As and to the extent that countries reduce their budget deficits to less than 3%, they can slow the pace of consolidation (Table). While in the next two years Germany, which has already balanced the public books, will cease its consolidation efforts, France will have to stay the course in the hope of reaching 3% in 2014. For Spain, Portugal and Greece, the effort will be less than that what has already been done, but it will continue to be a

significant burden on activity and employment, especially as the recessive impact of past measures continue to be felt.

In this context, the continuation of a recession is inevitable. GDP will fall by 0.4% in 2013. Unemployment is expected to break new records. A return to growth is not expected until 2014, but even then, in the absence of any relaxation of the fiscal dogma, hopes may again be disappointed since the anticipated growth of 0.9% will be insufficient to trigger any significant decline in unemployment. In addition, the return to growth will come too late to be able to erase the exorbitant social costs of this strategy, while alternatives to it are discussed inadequately and belatedly.

Table. Public balance and fiscal impulse in the euro zone countries

In GDP points

	Public deficit			Fiscal impulse	
	2012	2013 (p)	2014 (p)	2013 (p)	2014 (p)
Germany	0,2	-0,4	-0,1	0,1	0,0
Austria	-3,0	-2,5	-1,8	-0,6	-0,3
Belgium	-3,0	-2,8	-1,9	-0,5	-1,0
Spain	-10,2	-6,5	-5,8	-2,0	-1,1
Finland	-1,6	-1,5	-0,9	-0,8	-0,7
France	-4,8	-3,9	-3,0	-1,8	-1,4
Greece	-6,6	-5,4	-4,5	-3,8	-2,0
Ireland	-8,2	-8,4	-6,6	-1,9	-1,8
Italy	-3,0	-3,9	-3,4	-1,4	-0,7
Netherlands	-4,1	-3,4	-3,0	-1,7	-0,7
Portugal	-5,0	-4,4	-3,0	-2,1	-1,9
Euro zone 11*	-3,2	-2,6	-1,8	-1,1	-0,6

* Excluding Cyprus, Luxembourg, Malta, Slovakia and Estonia.

Spain: a lose-lose strategy

by Danielle Schweisguth

At a time when the [IMF](#) has publicly recognized that it

underestimated the negative impact of fiscal adjustment on Europe's economic growth, Spain is preparing to publish its public deficit figure for 2012. The initial estimate should be around 8% of GDP, but this could be revised upwards, as was the case in 2011 – while the target negotiated with the European Commission is 6.3%. With social distress at a peak, only a sustainable return to growth would allow Spain to solve its budget problems through higher tax revenue. But the austerity being imposed by Europe is delaying the return of economic growth. And the level of Spain's fiscal multiplier, which by our estimates is between 1.3 and 1.8, is rendering the policy of fiscal restraint ineffective, since it is not significantly reducing the deficit and is keeping the country in recession.

At a time when the [IMF](#) has publicly recognized that it underestimated the negative impact of fiscal adjustment on Europe's economic growth – the famous fiscal multiplier – Spain is preparing to publish its public deficit for 2012. The initial estimate should be around 8% of GDP, but this could be revised upwards as was the case in 2011. If we exclude the financial support for the banking sector, which is not taken into account in the excessive deficit procedure, the deficit then falls to 7% of GDP. This figure is still higher than the official target of 6.3% that was the subject of bitter negotiations with the European Commission. Recall that until September 2011, the initial target deficit for 2012 was 4.4% of GDP. It was only after the unpleasant surprise of the publication of the 8.5% deficit for 2011 (which was later revised to 9.4%) – which was well above the official 2011 target of 6% of GDP – that the newly elected government of Mariano Rajoy asked the European Commission for an initial relaxation of conditions. The target deficit was then set by Brussels at 5.3% of GDP for 2012. In July 2012, pressure on Spain's sovereign rate – which approached 7% – then led the government to negotiate with the Commission to put off the 3% target to 2014 and to set a deficit target of 6.3% of GDP in

2012.

Tableau. Growth, fiscal impulse and the public deficit in Spain

	2007	2008	2009	2010	2011	2012
GDP growth (%)	3,5	0,9	-3,7	-0,3	0,4	-1,4
Fiscal impulse (% of GDP)	0,6	1,0	1,3	-2,2	-0,9	-3,3
Public deficit* (% of GDP)	1,9	-4,5	-11,2	-9,7	-9,4	-8,0

* The public deficit includes the financial support given to the banking sector.
Sources : Ministerio de Hacienda y Administraciones Publicas, OFCE forecast for 2012.

But the strategy of trying to reduce the deficit by 2.6 GDP points while in a cyclical downturn proved to be ineffective and even counter-productive. Furthermore, the result has not been worth the effort involved, even though the European authorities have praised it repeatedly. A succession of three consecutive years of austerity plans of historic proportions (2010, 2011 and 2012) has led to only a very small improvement in the budget balance (Table). The deficit was reduced by 3.2 percentage points in three years, while two years of crisis were enough to expand it by 13.3 points (from 2007 to 2009). The fiscal impulse was -2.2 percentage points of GDP in 2010, -0.9 point in 2011 and -3.3 points in 2012, or a total of 6.4 GDP points of fiscal effort (68 billion euros). Yet the crisis has precipitated the collapse of the real estate market and greatly weakened the banking system. Since then, the country has plunged into a deep recession: GDP has fallen by 5.7% since the first quarter of 2008, which puts it 12% below its potential level (assuming potential growth of 1.5% per year), with 26% of the workforce currently unemployed, in particular 56% of the young people.

The deterioration of Spain's economic situation has hit tax revenue very hard. Between 2007 and 2011, the country's tax revenues have fallen further than in any other country in the euro zone. Revenue declined from 38% of GDP in 2007 to 32.4% in 2011, despite a hike in VAT (2 points in 2010 and 3 points

in 2012) and an increase in income tax rates and property taxes in 2011. The successive tax increases only slightly alleviated the depressive effect of the collapse of the tax base. VAT revenues recorded a sharp drop of 41% in nominal terms between 2007 and 2012, as did the tax on income and wealth (45%). In comparison, the decrease in tax revenue in the euro zone was much more modest: from 41.2% of GDP in 2007 to 40.8% in 2011. Finally, rising unemployment has undermined the accounts of the social security system, which will experience a deficit of 1 percentage point of GDP in 2012 for the first time in its history.

To compensate for the fall in tax revenue, the Spanish government had to take drastic measures to restrict spending to try to meet its commitments, including a 5% reduction in the salaries of civil servants and the elimination of their Christmas bonus; a hiring freeze in the public sector and increasing the work week from 35 to 37.5 hours (without extra pay); raising the retirement age from 65 to 67, along with a pension freeze (2010); a reduction of unemployment benefits for those who are unemployed more than seven months; and lowering severance pay from 45 days per year worked to 33 days (20 if the company is in the red). Even though household income has stagnated or declined, Spanish families have experienced a significant increase in the cost of living: a 5-point increase in VAT, higher electricity rates (28% in two years), higher taxes on tobacco and lower reimbursement rates for medicines (retirees pay 10% of the price and the employed 40% to 60%, depending on their income).

The social situation in Spain is very worrying. Poverty has increased (from 23% of the population in 2007 to 27% in 2011, according to Eurostat); households failing to pay their bills are being evicted from their homes; long-term unemployment has exploded (9% of the labour force); unemployed youth are a lost generation, and the best educated are emigrating. The VAT increase in September has forced households to tighten their

budgets: spending on food declined in September and October 2012, respectively, by 2.3% and 1.8% yoy. Moreover, the Spanish health system is suffering from budget cuts (10% in 2012), which led to the closure of night-time emergency services in dozens of municipalities and to longer waiting lists for surgery (from 50,000 people in 2009 to 80,000 in 2012), with an average waiting time of nearly five months.

Social distress is thus at a peak. The movement of the *indignados* led millions of Spaniards to take to the streets in 2012, in protests that were often violently suppressed by riot police. The region of Catalonia, the richest in Spain but also the most indebted, is threatening to secede, to the consternation of the Spanish government. On 24 January, the Catalan government passed a motion on the region's sovereignty, the first step in a process of self-determination that could lead to a referendum in 2014.

Only a lasting return to growth would enable Spain to solve its budget problems through higher tax revenue. But the tightening of financing conditions on Spain's sovereign debt since the summer of 2012 has forced the government to strengthen its austerity policy, which is delaying the return to economic growth. Furthermore, the European Commission has agreed to provide financial assistance to Spain only if it renounces its sovereignty in budget matters, at least partially, which the government of Mariano Rajoy is still reluctant to accept. The initiative of the European Commission on the exclusion of capital expenditures from calculations of the public deficit for countries close to a balanced budget, the details of which will be published in the spring, is a step in the right direction ([El Pais](#)). But this rule would apply only to the seven countries where the fiscal deficit is below 3% of GDP (Germany, Luxembourg, Sweden, Finland, Estonia, Bulgaria and Malta), which leaves out the countries facing the most difficult economic situations. Greater awareness of the social dramas that underlie these poor

economic performances should lead to greater respect for the fundamental rights of Europe's citizens. Moreover, in [the 2013 iAGS report](#) the OFCE showed that a restrained austerity policy (budget restrictions limited to 0.5 percent of GDP each year) is more effective from the viewpoint of both growth and deficit reduction in countries like Spain where the fiscal multipliers are very high (between 1.3 and 1.8, according to our estimates).

A recession is not inevitable

By Marion Cochard, Bruno Ducoudré and Danielle Schweisguth

The cold blast from the autumn forecasts continues with the publication of the European Central Bank's latest forecasts. Revising its growth outlook for the euro zone downwards (to -0.3% for 2013, against the forecast of 0.9% in September), the ECB in turn is now pointing to the reinforced austerity measures and the growing impact of uncertainty in the financial markets. It is clear that the intensity of the fiscal consolidation is paralyzing growth in the euro zone through the interplay of the fiscal multipliers, while not managing to restore confidence. In this note we show that the recessionary spiral that the euro zone is getting sucked into is not an inevitability.

In the first edition of the [2013 iAGS report](#), which was produced in partnership with the German IMK institute and the Danish ECLM institute, the OFCE offers an alternative strategy to the current fiscal consolidation policy. This alternative would make it possible to restore growth in the medium term while still meeting the European budget commitments. As Jérôme Creel showed in his latest post, ["Could France have a](#)

[different fiscal policy?](#)", there is room for budgetary manoeuvring in a way that is consistent with the current treaty framework.

Under the aegis of the European Commission, the European countries have pledged to continue their austerity programmes from 2013 to 2015 on a relatively large scale, especially if we take into account the efforts already made. Apart from Germany, where the cumulative fiscal impulse will be virtually nil, most European countries are planning to reduce their primary structural deficit by more than 2 GDP points between 2012 and 2015 (from -1.4 points for Finland to -7.5 points for Greece, cf. the table).

Table. Cumulative fiscal impulses in the euro zone

In GDP points

	Germany	France	Italy	Spain	Netherlands	Belgium	Greece	Portugal	Ireland	Austria	Finland
2010-2012	0,1	-4,1	-4,7	-7,0	-2,3	-1,5	-18,3	-9,1	-8,3	-1,1	-3,3
2013-2015	-0,3	-2,9	-2,1	-4,2	-2,9	-2,2	-7,5	-2,6	-5,7	-1,8	-1,4

These adjustments are being undertaken in a very poor economic climate, which has been marked by austerity budgets from 2010 to 2012: growth in the euro zone will be -0.4% in 2012 and -0.3% in 2013. However, according to a series of recent theoretical and empirical studies[\[1\]](#), the fiscal multipliers turn upwards as the economic cycle heads downwards. In this context, the speed and magnitude of the fiscal adjustment is especially costly in terms of growth, and thus counter-productive in terms of the fiscal consolidation.[\[2\]](#) Encouraging a return to growth by easing the austerity would enable the economies of the euro zone to pull out of their recessionary spiral, which is marked by a steep rise in unemployment.

In order to develop this alternative strategy, we used the iAGS model to carry out simulations for the euro zone countries over a period of 20 years. These were conducted in

two steps:

1. In our central scenario, we integrated the planned budget cuts announced by the various countries up to 2015. Starting from 2016, we calculated the fiscal impulses needed to achieve the 60% debt threshold by 2032, while limiting the size of these impulses to ± 0.5 GDP points per year. As shown in Figure 1 (central scenario), the structural adjustment carried out between 2010 and 2015 is significant enough in most countries to allow a relaxation of economic policy starting in 2016, while meeting the debt criterion by 2032.
2. For each country, we then decided on an alternative budget strategy by staggering the reduction of the structural deficit over time. This strategy consists in starting in 2013 with the implementation of fiscal impulses of a more limited amount in absolute value than those announced by the current governments (maximum ± 0.5 GDP points per year), and doing this until the adjustment is sufficient to achieve the debt target of 60% of GDP by 2032. This strategy leads to more measured fiscal adjustment for the euro zone countries in difficulty and to slightly positive fiscal impulses in countries whose debt trajectory is in better shape (Germany, Finland, and Italy). For the zone as a whole, the fiscal impulse is almost zero in 2013 and 2014, with the bulk of the adjustment spread from 2017 to 2024.

Figure 1. Fiscal impulses and difference in GDP between the central and alternative scenarios

Source : iAGS, authors' calculation.

Figure 1 shows the difference in the level of GDP between the two scenarios. Limiting the size of the fiscal impulses helps to achieve a higher level of GDP and is compatible with a debt target of 60% of GDP by 2032 (alternative scenario). The effectiveness of the fiscal consolidation is enhanced when it is being conducted in an environment that is less unfavourable to the economy. This strategy achieves the same debt target with a cumulative fiscal adjustment that is 50 billion euros less than in the central scenario.

According to our calculations, the alternative scenario would restore a 2% growth rate in the euro zone in 2013, compared with -0.3% if the planned fiscal policies are carried out. The revival of activity would boost the labour market and help to turn around the unemployment rate in 2013, with a decline to 10.2% in 2015, compared with 12.8% if the austerity policies are continued, representing 3 million fewer unemployed people in 2015.

The euro zone: confidence won't be enough

By [Céline Antonin](#), [Christophe Blot](#) and Danielle Schweisguth

This text summarizes the OFCE's October 2012 forecasts for [the economy of the euro zone](#).

After more than two years of crisis in the euro zone, this time the meeting of the European Council, held on 18 and 19 October, had nothing of the atmosphere of yet another last-chance summit. Even though discussions on the future banking union [\[1\]](#) were a source of tension between France and Germany, there was no sword of Damocles hanging over the heads of the European heads of state. However, it would be premature to assume that the crisis is coming to an end. It is sufficient to recall that the GDP of the euro zone has still not regained its pre-crisis level, and in fact declined again by 0.2% in the second quarter of 2012. This decline is forecast to continue, as we expect GDP to fall by 0.5% in 2012 and by 0.1% in 2013. Consequently, the unemployment rate in the euro zone, which has already surpassed its previous historical record from April 1997, will rise further, reaching 12.1% by end 2013. What then are the reasons for the lull? Can the euro zone quickly resume its growth and hope to finally put an end to the social crisis?

Since the end of 2011, Europe has adopted a new treaty (the Treaty on stability, coordination and governance, the TSCG) which is being ratified in the 25 signatory countries. The new law is specifically intended to strengthen both budgetary discipline – through the adoption of national golden rules – and solidarity through the creation of the European Stability Mechanism (ESM), in so far as the use of the ESM is conditional on ratification of the TSCG. On 6 September, the ECB unveiled the basic points of its new conditional purchase of sovereign debt ([see here](#)), which is aimed at reducing the interest rates of countries subject to the ESM. Thus, the risk premium, as measured by the difference between the Italian and Spanish sovereign interest rates and the German rate, after peaking on 24 July 2012, decreased respectively by 2.2 and 2.5 points (Figures 1 and 2). This is of course still far from

normal, but this lull is nevertheless welcome and it shows that the spectre of a breakup of the euro zone has receded.

Could this new wave of optimism be a precursor to an upturn in the economy of the euro zone? The answer to this question is, unfortunately, negative. The fiscal policies of countries in the zone are still highly restrictive, a situation that has even intensified in 2012, pushing Italy and Spain back into recession and deepening the recession that was already hitting Portugal and Greece. For the euro zone as a whole, the fiscal stimulus will come to 1.7 percent of GDP in 2012 (table). The series of votes on national budgets confirms this strategy of a forced reduction of budget deficits for 2013, with the overall fiscal consolidation for the euro zone as a whole coming to 1.3%. There will be significant differences between the countries, since in Germany the fiscal stimulus will barely be negative (-0.2 point) while in Spain, Italy and Greece it will be more than -2 GDP points. However, the recessionary impact of this synchronized fiscal consolidation will be even greater given that the euro zone countries are still at the bottom of the economic cycle. In these conditions, the targets for budget deficit reduction will not be met, which will inevitably raise the question of the appropriateness of further budget cuts. More and more Member States thus risk being caught in a vicious circle where low growth calls for further fiscal adjustments that in turn deepen the economic and social crisis. It is essential that any decision about improving the governance of the European Union or the transmission of monetary policy restores confidence and creates the conditions for a return to growth. But this will be insufficient to escape the recession and should not obscure the impact of the fiscal strategy.

Tableau. Fiscal stimulus in the euro zone countries

In GDP points

	2009	2010	2011	2012	2013
Germany	0,7	1,5	-0,9	-0,5	-0,2
Austria	0,4	0,6	-1,6	-0,1	-0,9
Belgium	1,9	-0,3	-0,1	-1,1	-0,8
Spain	3,8	-2,5	-1,1	-3,4	-2,4
Finland	0,4	1,5	-1,6	-0,4	-1,3
France	2,3	-0,5	-2,9	-1,6	-1,8
Greece	3,2	-8,0	-5,3	-5,0	-3,9
Ireland	2,2	-4,4	-1,5	-2,4	-1,8
Italy	0,8	-0,4	-1,2	-3,2	-2,1
Netherlands	4,0	-1,1	-0,2	-1,0	-1,2
Portugal	5,0	-0,7	-3,7	-3,7	-1,8
Euro zone 11*	1,8	-0,3	-1,3	-1,7	-1,3

* Excluding Cyprus, Luxembourg, Malta, Slovakia, Slovenia and Estonia.

Note : The fiscal stimulus is measured by the opposite of the variation in the cyclically adjusted primary balance, that is, excluding interest charges and exceptional revenue: it approximates the discretionary budget policy.
