

Holding to the required course

By [Eric Heyer](#)

[This text summarizes the OFCE's 2013-2014 forecasts for the French economy.](#)

In 2013, the French economy should see negative annual average growth, with a fall in GDP of 0.2%, before a modest recovery in 2014, with growth of 0.6 % (Table 1). This particularly mediocre performance is far from the path that an economy pulling out of a crisis should be taking.

Table 1. Summary of the forecast for 2013 and 2014

In %, annual average

Sources : INSEE, quarterly accounts; OFCE *e-mod.fr* forecast for 2013 and 2014.

Four years after the start of the crisis, the French economy has a substantial potential for recovery: this should have led to average spontaneous growth of about 2.6% per year in 2013 and 2014, making up some of the output gap accumulated since

the onset of the crisis. But this spontaneous recovery is being hampered mainly by the introduction of fiscal savings plans in France and across Europe. To meet its commitment to cut the public deficit to 3% by 2014, the French government will have to hold to the course of fiscal consolidation it adopted in 2010, which was imposed by the European Commission in all the euro zone countries. This budget strategy should slash 2.6 percentage points off GDP growth in France in 2013 and 2.0 percentage points off GDP in 2014 (Table 2).

Table 2. The obstacles to growth in France during the years 2013 and 2014

Sources : INSEE, OFCE calculations.

By setting a pace far from its potential, the expected growth will aggravate the output gap built up since 2008, with the labour market thus continuing to worsen. The unemployment rate will rise steadily to 11.6% in late 2014.

Only a shift in European fiscal strategy could halt the rise in unemployment. This would mean limiting the negative fiscal stimulus to 0.5 percent of GDP instead of the total of 1.0 points planned in the euro zone in 2014. This reduced fiscal

effort could be repeated until the public deficit or debt reaches a defined goal. Compared to current plans, because the effort would be measured the burden of adjustment would be spread more fairly over the taxpayers in each country, avoiding the pitfall of drastic cuts in the public budgets. This new strategy would lead to a slower reduction in the public deficit (-3.4% in 2014 against -3.0% in our central scenario), but also and especially to higher economic growth (1.6% against 0.6%). This “less austerity” scenario would allow the French economy to create 119,000 jobs in 2014, *i.e.* 232,000 more than in our central forecast, and unemployment would fall instead of continuing to increase.

20 billion euros in reductions on employer payroll taxes on low-wages. But will it create jobs?

By [Eric Heyer](#) and [Mathieu Plane](#)

Every year the State spends nearly 1 percentage point of GDP, *i.e.* 20 billion euros, on general reductions in employer payroll taxes on low wages. It is thus legitimate to ask whether a programme like this is effective. A large number of empirical studies have been conducted to try to assess the impact of this measure on employment, and have concluded that it creates between 400,000 and 800,000 jobs.

As these estimates are performed using sector models, they do

not take into account all the effects resulting from a policy of reduced social contributions on low wages, and in particular the impact of macroeconomic feedback, *i.e.* the effect of income gains, competitiveness gains and the financing of the measure.

In a recent study published in the [Revue de l'OFCE \(Varia, no. 126, 2012\)](#), we have attempted to supplement these evaluations by taking into account all the impacts resulting from a policy of reducing contributions on low wages. To do this, we performed a simulation of this measure using the OFCE's macro-econometric model, *emod.fr*.

We were able to break down the various impacts expected from these reductions on employment costs into two basic categories:

1. An overall "substitution effect", which breaks down into a macroeconomic capital-labour substitution, to which is added what can be called an "assessment effect" linked to the targeting of the measure at low wages;
2. A "volume effect", which can be broken down between rising domestic demand due to lower prices and higher payroll, competitiveness gains due to improved market share internally and externally, and the negative effect of the measure's financing, whether that involves raising the tax burden (*prélèvements obligatoires*) or cutting public spending.

Based on our assessment, summarized in Table 1, the exemptions from employer social contributions on low wages lead to creating 50,000 jobs in the first year and about 500,000 at the end of five years. Of the 503,000 jobs expected within five years, 337,000 would be due to the overall substitution effect, with 107,000 linked to the macroeconomic capital-labour substitution and 230,000 to the "assessment effect" linked to the sharp reduction in labour costs on low wages. In addition, 82,000 jobs are generated by the addition to

household income and 84,000 by competitiveness gains and the positive contribution of foreign trade to the change in GDP. On the other hand, the “volume effect” on employment becomes negative if the measure is financed *ex post*: increasing a representative mix of the fiscal structure reduces the overall impact of the measure by 176,000 jobs at 5 years; reducing a representative mix of the structure of public spending reduces employment by 250,000 at 5 years.

Table 1. Impact on employment of the exemptions on employer social security contributions on low wages without taking into account the reaction of our trade partners

1000s

Effect at...	Substitution effect		Volume effect		Total w/o financing	Ex post financing		Total w/ financing
	Capital/Labour	Assessment effect	Domestic demand	Competitiveness		Tax mix	Public spending mix	
...1 year	4	24	13	9	50	-26	-71	24 -21
...5 years	107	230	82	84	503	-176	-250	327 253

Source: OFCE calculations, *e-mod.fr*.

Some of the jobs created come from competitiveness gains related to taking market share from our trading partners due to lower prices of production following the reduction in labour costs. This price-competitiveness mechanism works only if, first, firms pass on the reductions in social contributions in their prices of production, and second, our trading partners are willing to lose market share without a fight. We therefore simulated a polar opposite case in which it is assumed that our trading partners respond to this type of policy by enacting similar measures, which would negate our external gains.

While this does not modify the impact on employment related to the “substitution effect”, this assumption does change the “volume effect” of the measure, eliminating 84,000 jobs from gains in market share and increasing the negative effect of *ex post* financing due to the measure’s multiplier effect on

weaker activities. In total, in the scenario in which the measure is funded *ex post* and does not allow gains in competitiveness, the exemptions on employer social security contributions on low wages would create between 69,000 and 176,000 jobs within five years, depending on how it is financed (Table 2). This result puts the initial figure of 500,000 jobs into perspective.

Table 2. Impact on employment of exemptions on employer social security contributions on low wages if our trade partners do adopt a similar policy

Higher unemployment in France, greater poverty in Germany

By [Eric Heyer](#)

Will France be the new Greece, as *The Economist* has argued? Should French reforms be accelerated and be modelled on those implemented in Germany ten years ago? For German public opinion, for its authorities and for a large number of economic experts, the answer is obvious. Not only does Germany

have a lower deficit, but unlike its French neighbour it has also managed to significantly reduce its unemployment rate. Starting from a similar level in the early 2000s (close to 7.7% at end 2001), the unemployment rate now stands at 5.4% of the labour force in Germany, 4.5 percentage points below the level in France (Figure 1).

Figure 1 : Changes in unemployment in Germany and France over the last 20 years

Source : ILO.

The purpose of this note is not to revisit the reasons for this difference, which have already been the subject of posts on this blog (see in particular the impact of demography, by [G. Cornilleau](#), of the reduction in working hours, by [E. Heyer and M. Plane](#), and of the rise in male-female inequalities, by [H. Périvier](#)). The point rather is simply to note that the reduction of unemployment in Germany has been accompanied by a steep rise in poverty.

According to Eurostat, over the past six years the poverty rate (measured at the threshold of 60% of median income) has

risen by 3.6 percentage points in Germany, four times more than the rise observed in France (0.9 point). In 2011, despite the sharp drop in unemployment and the large differential with France, the poverty rate in Germany was 1.8 points higher than the level observed in France, *i.e.* a difference of over 11% (Figures 2 & 3).

Graphique 2 : Poverty rate (60 % of median income) in 2011

Source : Eurostat.

Figure 3 : Changes in the unemployment rate and poverty rate (60 % of median income) in France and in Germany (2005-2011)

Source : Eurostat.

There is, therefore, a hidden side to the reforms implemented in Germany over the past ten years, which have led to lower unemployment but greater poverty.

A review of the recent literature on fiscal multipliers: size matters!

By [Eric Heyer](#)

Are the short-term fiscal multipliers being underestimated? Is there any justification for the belief that fiscal restraint can be used to drastically reduce deficits without undermining business prospects or even while improving the medium-term situation? This is the question that the IMF tries to answer in its latest [report on the world economic outlook](#). The Fund devotes a box to the underestimation of fiscal multipliers during the 2008 crisis. While until 2009 the IMF had estimated that in the developed countries they averaged about 0.5, it now calculates that they have ranged from 0.9 to 1.7 since the Great Recession.

This reassessment of the value of the multiplier, which [X. Timbeau discusses in an interesting reading](#) on the basis of a “corrected apparent” multiplier, builds on the numerous studies carried out by IMF researchers on the issue and especially that of [Batini, Callegari and Melina \(2012\)](#). In this article, the authors draw three lessons about the size of the fiscal multipliers in the euro zone, the U.S. and Japan:

1. The first is that gradual and smooth fiscal consolidation is preferable to a strategy of reducing public imbalances too rapidly and abruptly.
2. The second lesson is that the economic impact of fiscal consolidation will be more violent when the economy is in recession: depending on the countries surveyed, the difference is at least 0.5 and may be more than 2. This observation was also made in another study by the IMF ([Corsetti, Meier and Müller \(2012\)](#)) and is explained by the fact that in “times of crisis” more and more economic agents (households, firms) are subject to very short-term liquidity constraints, thus maintaining the recessionary spiral and preventing monetary policy from functioning.
3. Finally, the multipliers associated with public expenditure are much higher than those observed for taxes: in a recessionary situation, at 1 year they range

from 1.6 to 2.6 in the case of a shock to public spending but between 0.2 and 0.4 in the case of a shock on taxes. For the euro zone, for example, the multiplier at 1 year was 2.6 if government spending was used as an instrument of fiscal consolidation and 0.4 if the instrument was taxation.

As the economic crisis continues, the IMF researchers are not the only ones raising questions about the merits of the fiscal consolidation strategy. In an NBER working paper in 2012, two researchers from Berkeley, [Alan J. Auerbach and Yuriy Gorodnichenko](#), corroborate the idea that the multipliers are higher in recessions than in periods of expansion. [In a second study](#), published in the *American Economic Journal*, these same authors argue that the impact of a shock on public expenditure would be 4 times greater when implemented during an economic downturn (2.5) than in an upturn (0.6). This result has been confirmed for the US data by three researchers from the University of Washington in St. Louis ([Fazzari et al. \(2011\)](#)) and by two economists at the University of Munich ([Mittnik and Semmler \(2012\)](#)). This asymmetry was also found for the data on Germany in a study by a Cambridge University academic and a Deutsche Bundesbank researcher, [Baum and Koester \(2011\)](#).

In other work, a researcher at Stanford, [Hall \(2009\)](#), affirms that the size of the multiplier doubles and is around 1.7 when the real interest rate is close to zero, which is characteristic of an economy in a downturn, as is the case today in many developed countries. This view is shared by a number of other researchers, including two at Berkeley and Harvard, [DeLong and Summers \(2012\)](#), two from the Fed, [Erceg and Lindé \(2012\)](#), those of the [OECD \(2009\)](#), those of the [European Commission \(2012\)](#) and in some recent theoretical work ([Christiano, Eichenbaum and Rebelo \(2011\)](#), [Woodford \(2010\)](#)). When nominal interest rates are blocked by the zero lower bound, anticipated real interest rates rise. Monetary policy can no longer offset budgetary restrictions and can even

become restrictive, especially when price expectations are anchored on deflation.

As already noted by J. Creel on this blog ([insert link to the post of 22.02.12](#)) with respect to the instrument to be used, *i.e.* public spending or taxation, other IMF economists together with colleagues from the European Central Bank (ECB) the US Federal Reserve (FED), the Bank of Canada, the European Commission (EC) and the Organization for Economic Cooperation and Development (OECD) compared their assessments in an article published in January 2012 in the *American Economic Journal: Macroeconomics* ([Coenen G. et al. \(2012\)](#)). According to these 17 economists, on the basis of eight different macroeconomic models (mainly DSGE models) for the United States, and four models for the euro zone, the size of many multipliers is large, particularly for public expenditure and targeted transfers. The multiplier effects exceed unity if the strategy focuses on public consumption or transfers targeted to specific agents and are larger than 1.5 for public investment. For the other instruments, the effects are still positive but range from 0.2 for corporation tax to 0.7 for consumer taxes. This finding is also shared by the [European Commission \(2012\)](#), which indicates that the fiscal multiplier is larger if the fiscal consolidation is based on public expenditure, and in particular on public investment. These results confirm those published three years ago by the [OECD \(2009\)](#) as well as those of economists from the Bank of Spain for the euro zone ([Burriel et al \(2010\)](#)) and from the Deutsche Bundesbank using data for Germany ([Baum and Koester \(2011\)](#)). Without invalidating this result, a study by [Fazzari et al \(2011\)](#) nevertheless introduced a nuance: according to their work, the multiplier associated with public spending is much higher than that observed for taxes but only when the economy is at the bottom of the cycle. This result would be reversed in a more favourable situation of growth.

Furthermore, in their assessment of the US economy,

researchers at the London School of Economics (LSE) and the University of Maryland, [Ilzetzki, Mendoza and Vegh \(2009\)](#), highlight a high value for the fiscal multiplier for public investment (1.7), *i.e.* higher than that found for public consumption. This is similar to the results of other IMF researchers ([Freedman, Kumhof, Laxton and Lee \(2009\)](#)).

In the recent literature, only the work of Alesina, a Harvard economist, seems to contradict this last point: after examining 107 fiscal consolidation plans, conducted in 21 OECD countries over the period 1970-2007, Alesina and his co-authors ([Ardagna in 2009](#) and [Favero et Giavazzi in 2012](#)) conclude first that the multipliers can be negative and second that fiscal consolidations based on expenditure are associated with minor, short-lived recessions, while consolidations based on taxation are associated with deeper, more protracted recessions. In addition to the emphasis on the particular experiences of fiscal restraint (Scandinavian countries, Canada), which are not found when including all experiences with fiscal restriction (or expansion), the empirical work of Alesina *et al.* suffers from an endogeneity problem in the measurement of fiscal restraint.

The notion of a narrative record of fiscal impulse helps to avoid this endogeneity. For example, in the case of a real estate bubble (and more generally in cases of large capital gains), the additional tax revenues from the real estate transactions results in a reduction in the structural deficit, as these revenues are not cyclically based (the elasticity of revenues to GDP becomes much higher than 1). So these are associated with an expansionary phase (in conjunction with the housing bubble) and a reduction in the structural deficit, which artificially strengthens the argument that reducing the public deficit may lead to an increase in activity, whereas the causality is actually the reverse.

With the exception of the work of Alesina, a broad consensus emerges from the recent theoretical and empirical work in the

existing economic literature: a policy of fiscal consolidation is preferable in periods of an upturn in activity, but is ineffective and even pernicious when the economy is at a standstill; if such a policy is to be enacted in a downturn, then tax increases would be less harmful to the activity than cuts in public spending ... all recommendations contained in [Creel, Heyer and Plane \(2011\)](#).

Why has French growth been revised downwards?

By Bruno Ducoudré and [Eric Heyer](#)

In its [October 2012 forecasts](#), the OFCE has revised its growth forecast for 2012 and 2013. The major international institutions, the OECD, the IMF and the European Commission, also regularly review their growth forecasts to incorporate newly available information. An analysis of these revised forecasts is particularly interesting in that it shows that these institutions use low fiscal multipliers in developing their forecasts. In other words, the recessionary impact of fiscal policy has been underestimated by the OECD, the IMF and the European Commission, leading to substantial revisions of their growth forecasts, as is evidenced by the dramatic shifts by the [IMF](#) and the [European Commission](#) in the size of the multipliers.

Graphique 1. Révisions of growth in French GDP for 2012

Note : Growth in 2012 is reviewed four times each year by each institution. The first revision took place in April 2011, the second in October 2011, the third in April 2012 and the final one in October 2012. The OECD has not yet published its latest revisions.

Sources : IMF, European Commission, OECD, OFCE October 2012 calculations and forecasts.

Figure 1 shows that between the forecast made in April 2011 and the latest available forecast, the government, like all the other institutions, revised its growth forecast for France sharply downwards.

The austerity policies have also been strengthened at the same time, particularly in the euro zone. The European countries undertook their stability program in order to return to balanced public finances within three years. In contrast to the years before the crisis, the implementation of these commitments is now considered a necessary or even sufficient condition for pulling out of the crisis. Moreover, in a context of financial uncertainty, being the only State not to meet its commitment to fiscal consolidation would be punished immediately by the markets (higher sovereign rates, a downgraded rating, a fine from the European Commission, implicit contagion of sovereign defaults). But in trying to reduce their deficits abruptly and synchronously, Europe's governments are inducing new slowdowns in activity.

A vicious circle has been created: with each downward revision in their forecasts for 2012 growth, Europe's governments implement new austerity measures to meet their deficit commitments. This has happened in France, but especially in Italy, which has virtually tripled its fiscal effort, and in Spain, which is now engaged in the greatest austerity effort of any major European country.

According to our estimates for the French economy (that is to say, using a multiplier of 1), the series of fiscal savings plans adopted at the national level have led to revising growth downwards by -1.1 points between April 2011 and October 2012 (from an impact of -0.5 GDP point to -1.6 points). Since these same policies are in force in our trading partners, this has led to revising growth for this same period by 0.9 point due to foreign trade (from -0.5 GDP point to -1.4 point) (Figure 2).

Graphique 2. Impact of the latest fiscal adjustments on 2012 growth

Source : OFCE October 2012 calculations and forecasts.

For the year 2012, the OFCE's revisions for the French economy can be explained in full simply by the escalation in the fiscal savings measures announced over the last 12 months,

i.e. the national plans and those applied by our partner countries (Table 1).

Tableau 1. Determinants of the revisions to the OFCE forecast for France for 2012

	April 2011	October 2012	Revision
GDP growth	1,7	0,1	-1,6
(a) - Austerity measures (in GDP pt)	-0,6	-1,60	-1,0
(b) - Value of the fiscal multiplier	0,95	0,95	0,0
Impact of austerity plans in France (a + b)	-0,5	-1,6	-1,1
Impact of the austerity measures of France's partners	-0,5	-1,4	-0,9
Other adjustment factors			0,4

Source : OFCE calculations.

Leaving aside this escalation of austerity, our diagnosis of the French economy has changed very little over the last 18 months: without it, we would have even revised our growth forecast slightly upwards (0.4%).

France: will the war of the 3% take place?

By [Eric Heyer](#)

This text summarizes the [OFCE's October 2012 forecasts for the French economy](#).

The French economy is expected to see average annual growth of 0.1% in 2012 and 0.0% in 2013. This performance is particularly poor and far from the path that an economy recovering from a crisis would normally experience.

Four years after the onset of the crisis, the French economy has real potential for a rebound: this should lead to

spontaneous average growth of about 3.0% per year in 2012 and 2013, making up some of the output gap built up since the start of the crisis. But this spontaneous recovery is being hampered, mainly by the establishment of budgetary savings plans in France and throughout Europe. The fiscal consolidation strategy imposed by the European Commission is likely to slice nearly 6 percentage points off GDP in France during 2012 and 2013.

Table 1. The brakes on growth in France

En points of GDP

Rythm	... quaterly		... annually	
	2012	2013	2012	2013
<i>Spontaneous recovery</i>	0,8	0,8	2,1	3,1
<i>Budget impact</i>	-0,4	-0,4	-1,6	-1,7
<i>Oil shock</i>	-0,05	0,0	-0,2	0,0
<i>External environment</i>	-0,4	-0,3	-1,4	-1,2
<i>Achievement</i>			-1,0	-0,2
Growth forecasts	-0,04	0,04	0,1	0,0

Sources : INSEE, OFCE calculations.

By setting a pace that is far from its potential, the expected growth will increase the output gap accumulated since 2008 and will lead to a further deterioration on the labour market. The unemployment rate will rise steadily and hit 11% by late 2013.

Moreover, the reduction of the budget deficit expected by the Government due to the implementation of its consolidation strategy – the target for the general government deficit is 3% of GDP in 2013 – will be partially undermined by the shortfall in tax revenue due to weak growth. The general government deficit will come to 3.5% in 2013.

Under these conditions, should the government do whatever it can to fulfil its commitment to a 3% deficit in 2013?

In a context of financial uncertainty, being the only State not to keep its promise of fiscal consolidation is a risk, *i.e.* of being punished immediately by an increase in the financial terms on the repayment of its debt. This risk is

real, but limited. The current situation is that of a “liquidity trap” and abundant savings. The result is a “flight to quality” phenomenon on the part of investors seeking safe investments. But among these are both German and French government bonds. Under these conditions, reducing the government deficit by 1 GDP point instead of 1.5 point would have very little impact on French bond rates.

However, maintaining a target of a 3% deficit in 2013 could have a dramatic impact on economic activity and employment in France. We simulated a scenario in which the French government maintains its budgetary commitment regardless of the costs and the economic situation. If this were to occur, it would require the adoption of a new programme of budget cuts in the coming months in the amount of 22 billion euros.

This strategy would cut economic activity in the country by 1.2% in 2013. It would lead to a further increase in the unemployment rate, which would reach 11.7% at year end, nearly 12%. As for employment, this obstinacy would intensify job losses, costing nearly 200,000 jobs in total.

A darker scenario is also possible: according to our forecasts, and taking into account the draft budget bills known and approved, no major European country would meet its deficit reduction commitments in 2013. By underestimating the difficulty of reaching inaccessible targets, there is a high risk of seeing the euro zone countries locked into a spiral where the nervousness of the financial markets would become the engine driving ever greater austerity. To illustrate this risk, we simulated a scenario in which the major euro zone countries (Germany, France, Italy and Spain) implement new austerity measures to meet their deficit targets in 2013. Adopting such a strategy would result in a strong negative shock to economic activity in these countries. For the French economy, it would lead to additional austerity that either at the national level or coming from its euro zone partner countries would cause a severe recession in 2013. French GDP

would fall by more than 4.0%, resulting in a further increase in the unemployment rate, which would approach 14%.

Table 2. Illustrative scenarios of risks to French growth

In %	2011	2012*	2013*

How France can improve its trade balance*

By [Eric Heyer](#)

Prime Minister Jean-Marc Ayrault has made a commitment to restoring France's balance of trade, excluding energy, by the

end of his five-year term. Without addressing the curious anomaly of leaving the energy deficit out of the analysis of the country's trade position, as if it did not count in France's dependence on the rest of the world, we will examine the various solutions that the government could use to achieve this goal.

The first solution is to do nothing and to wait until the austerity policy that has been implemented in France through public spending cuts and higher taxes reduces consumer spending. In the face of higher unemployment and the resulting increase in household precautionary savings, the French will cut back on consumption. However, since some of this comes from outside France, this will limit imports into France from abroad and, everything else being equal, improve the country's trade balance.

This solution, it is clear, not only is not virtuous, as it relies on a reduction in employee purchasing power and rising unemployment, but it also has little chance of success, because it assumes that French exports will not follow the same path as imports and will continue to grow. However, since our partner countries are following this same strategy of a rapid return to balanced public finances, their austerity policies will result in the same dynamics as described above for France, thereby reducing their own domestic demand and hence their imports, some of which are our exports.

As a result, and since the austerity programmes of our partners are more drastic than ours, it is very likely that our exports will decline faster than our imports, thus exacerbating our trade deficit.

The second solution is to increase our exports. In a context where our European partners, who represent 60% of our trade, are experiencing low or even negative growth, this can be achieved only through gains in market share. Lowering the cost of labour seems to be the fastest way to do this. But in the

midst of an effort to re-establish a fiscal balance, the only way to lower the charges on labour is to transfer these to another tax: this was the logic of the "social VAT" set up by the previous government, but repealed by the new one, which seems to lean more towards transferring these to the CSG tax, which has the advantage of having a larger tax base, affecting all income, including capital income.

But in addition to the fact that this strategy is not "cooperative", since it resembles a competitive devaluation and thus is essentially aimed at gaining market share from our euro zone partners, there is no indication that it would be sufficient. Indeed, there is nothing to prevent our partners from adopting the same approach, particularly since their economic situation is worse than ours, and this would cancel all or part of any potential gains in our competitiveness.

The last solution consists of making the country more competitive by raising the productivity of our employees and by specialising in high value-added sectors that are not subject to competition from the emerging countries with their low costs.

This is a medium-term strategy and requires the establishment of policies to promote innovation, research and development, and training. It also means expanding the range of our traditional products such as automobiles, but also specializing in the industries of the future.

The need for a transition to an ecological mode of production that is more energy-efficient could represent this industry of the future, and therefore be the solution to our trade deficit.

The situation on the labour market in France*

By [Eric Heyer](#)

The French economy is facing a number of imbalances, with the two main ones being:

- a public deficit that at end 2012 is likely to come to about 4.5 GDP points, or close to 100 billion euros;
- a lack of jobs, which is leading to mass unemployment.

While the first point is the object of great attention, and while it has been and remains the main or even the sole concern of every EU summit over the last three years and is at the heart of the European strategy on the crisis, it must be acknowledged that this is not unfortunately the case for the second point. However, it is not unreasonable to ask whether the priority in a country as rich as France should actually be to reduce the deficit at all costs even if this may worsen the plight of society's most vulnerable and make it more difficult for them to access the labour market.

Since the beginning of the crisis in early 2008, the French economy has destroyed more than 300,000 jobs, and the number of unemployed as defined by the International Labour Office has increased by 755,000. More than 2,700,000 French are now

without jobs, i.e. 9.6% of the active population.

And this figure undoubtedly underestimates the real situation. The French economy is currently creating only mini part-time jobs that don't last long; in the last quarter, 4.5 million job contracts were signed: 3 out of 4 of these were contracts lasting less than one month (mostly 1 day to 1 week). Someone who signed one of these contracts and is looking for a job at the end of the same month is not counted as unemployed. Their inclusion would increase the jobless numbers and push the French economy a little further into mass unemployment.

Moreover, and this is more disturbing, the unemployed are getting older while remaining jobless – the number of long-term unemployed is continuing to shoot upwards – and thereby lose out in terms of both job skills and financially as they shift from unemployment benefits onto the social minima; in a study we conducted at OFCE for the National Observatory on Poverty and Social Exclusion (ONPES), we estimated that in France 100 additional unemployed during this crisis will lead to 45 more people in poverty in 2012. Thus, even stabilizing unemployment would not lead to halting the deterioration of people's situation – on the contrary.

It is therefore urgent to reverse current trends with respect to employment and unemployment.

The surest way to do this is to put the French economy onto a trajectory of dynamic growth: recall that low but positive growth is not enough for the French economy to create jobs again, as, given gains in productivity, the country's economy needs to grow by more than 1% in order to unleash a spiral of job creation. Moreover, given the continuation of demographic growth and the postponement of the retirement age, the labour force is increasing by 150,000 people every year. It is thus necessary to create more than 150,000 jobs in France before unemployment will begin to fall, which corresponds to growth of over 1.5%.

However, in light of the austerity policies being implemented in France and by our European partners, this level of growth seems unthinkable in 2012 and 2013.

So how can a further explosion of unemployment be stopped in the near future?

The first step would be to change Europe's strategy by establishing, among other things, a "more moderate" austerity.

The second step would be to adopt the strategy Germany is using for the crisis, that is to say, to reduce working time by massively resorting to part-time work and to partial unemployment schemes. Remember that 35% of German employees are hired part-time, as against 17% in France. Furthermore, during the crisis 1.6 million Germans have been on a partial unemployment programme, compared with 235,000 in France. All this has helped Germany to keep unemployment down during the crisis.

The last solution is to use what in France is called the "social treatment of unemployment". As the private sector is still destroying jobs, the public sector would offset part of this by creating subsidized jobs.

The government seems to be taking this last path: 100,000 "jobs for the future" will be created in 2013 and 50,000 in 2014.

In the short term, given the economic situation, this strategy seems to be the most effective and the least expensive. However, in the medium term, it cannot replace a policy of growth.

Youth “jobs of the future”: What impact on employment and government finances?

[Éric Heyer](#) and [Mathieu Plane](#)

The bill aimed at creating 150,000 “jobs for the future” [*emplois d’avenir*] for unemployed youth will be submitted to Parliament in October 2012. These 150,000 “jobs for the future” are to be reserved primarily for young people from deprived areas. What will be the net impact on employment and public finances?

These full-time jobs, which are planned to last a maximum of five years and are paid at least the minimum wage (SMIC), will be 75% funded by the State, with the rest of the cost being borne by local authorities, associations, foundations and business. According to the Minister of Labour and Employment, Michel Sapin, the goal is to create 100,000 jobs starting in 2013.

The ex-ante cost of the measure

The gross annual cost of a “jobs for the future” contract paid at the SMIC on the basis of a 35-hour full-time week is 24,807 euros. The cost per job for the public finances is 12,831 euros for 75% of the gross wage and 4,807 euros for the exemption from employer social contributions. To this should be added the remaining cost for the employer, or 7,276 euros,

when the employer is not a public entity. Based on the assumption that two-thirds of the “jobs for the future” created would be in the non-market sector and one-third in the market sector, the total average annual cost for the public finances therefore comes to 23,015 euros per contract. When fully implemented, the cost of creating 150,000 “jobs for the future” is estimated at 3.45 billion euros a year.

The impact of the measure

By assuming the creation of 100,000 subsidized jobs in the non-market sector and 50,000 in the market sector, the impact would be as follows:

With relatively weak deadweight and substitution effects in the non-market sector (20% according to Fontaine and Malherbet, 2012), 100,000 “jobs for the future” would lead to the net creation of 80,000 jobs over the presidential term. The *ex-ante* annual cost to the public finances for 100,000 “jobs for the future” in the non-market sector would be 0.12 GDP point, but *ex post* this would be only 0.07 GDP point because of the extra income – and thus tax and social security revenue – generated by the jobs created.

The state aid (75% of the gross salary) allows a reduction in the cost of labour of 52% at the SMIC level, *i.e.* a total reduction of 71% of the actual cost of a minimum wage job if one includes the reductions in charges. With the impact of employment elasticities at a maximum labour cost at the level of the SMIC (1.2 according to a DGTPE study in 2007), the 50,000 “jobs of the future” in the market sector would generate 27,300 jobs. The *ex-ante* cost to the public finances would be 0.05 GDP point, and 0.03 GDP point *ex post*.

Ultimately, the measure would eventually create 107,300 jobs (about 25% of these in the market sector), *i.e.* an annual net creation of 72%. The *ex-ante* cost for the public finances would be 0.17 GDP point, but the *ex-post* impact of the measure

on the public balance would be only -0.1 GDP point because of the extra tax and social security revenue generated by the jobs created and the consequent income gains (Table 1).

Table 1. Impact at 5 years of the measure on employment and the public finances

Création of...	Jobs (1 000)	Net creation (%)	<i>Ex ante</i> public balance (in GDP points)	<i>Ex post</i> public balance (in GDP points)
... 100,000 in the non-market sector	80 000	80 %	0.12	0.07
50,000 in the non-market sector	27 300	55 %	0.05	0.03
Total (150,000 jobs for the future)	107 300	72 %	0.17	0.10

Source : OFCE calculations.

According to statements by the Minister of Labour and Employment, two-thirds of the “jobs for the future” will be set up in 2013. To assess the impact of this measure over the presidential term, we started from the assumption that 25,000 full-time “jobs for the future” with a term of 5 years would be created each quarter from the beginning of 2013 until mid-2014.

Based on this profile for the implementation of the “jobs for the future”, the net new job creation expected in 2013 would be 71,600, with 35,700 in 2014, and then 0 from 2015 to 2017. The *ex-post* impact on the public balance would be 0.04 GDP point in 2013 and 0.06 point in 2014, *i.e.* a cumulative impact on the public finances of 0.1 GDP point over time.

Table 2. Impact of the measure on employment and the public finances from 2013 to 2017

	2013	2014	2015	2016	2017
Jobs for the future (1000s)	100 000	50 000	0	0	0
Net job creation (1000s)	71 600	35 700	0	0	0
<i>Ex-ante</i> annual cost (billion euros)	1.44	3.31	3.45	3.45	3.45
<i>Ex ante</i> impact on public balance (GDP pts)	0.07	0.09	0.01	0.00	0.00
<i>Ex post</i> impact on public balance (GDP pts)	0.04	0.06	0.00	0.00	0.00

Social action, but no end of the crisis

Evaluation of the five-year economic programme (2012-2017)

By [Eric Heyer](#), [Mathieu Plane](#), [Xavier Timbeau](#)

The initial decisions of the five-year programme are coming amidst an extremely difficult and very uncertain economic situation. In a recent [OFCE Note](#) (No. 23 of 26 July 2012), we first analyze the macroeconomic context for François Hollande’s five-year programme and the XIVth legislature. This analysis details the likely consequences for the next five years of the strategy currently being implemented in Europe. We evaluate both the cost to the public finances as well as the impact on economic activity, employment and the distribution of income. In part two, we analyze the public policy choices being given priority by the new government, including both those aimed at the young (generation contracts, jobs of the future), at some seniors (revision of the pension reform), and at the middle and lower classes (allowance for the start of school, boost to the minimum wage, Livret A bank accounts, rent control, revised taxation of overtime), as well

as those intended to revive certain public expenditures that are deemed essential (public jobs in education, the justice system and the police in the “public finance” section, and public early childhood services).

François Hollande was elected President of the French Republic at a time when France and Europe are going through an unprecedented crisis. Unemployment in metropolitan France has increased by over 2 percentage points since the crisis began and is now (in ILO terms, 9.6% of the workforce in first quarter 2012) approaching the record levels of 1997 (10.5%). Gross domestic product per capita in terms of purchasing power has fallen since 2008 by 3%. If the growth trend for the five years preceding the crisis had continued at that same rate from 2008 until early 2012, GDP per capita would now be 8% higher than it is. The current account has deteriorated during the crisis by 1.5 GDP points (25.7 billion euros, 10 billion of which is for the oil bill), thus worsening France’s net balance of trade by 7.8 GDP points. The public debt increased by 577 billion (nearly 30 GDP points), and at the beginning of 2012 represented almost 90% of GDP. Industry has paid a heavy price for the crisis (almost 300,000 jobs lost), with all signs indicating that the job losses and closures of industrial sites might be irreversible.

Yet this dire situation, which can be chalked up to the crisis that began in 2008, is not over. Due to the impact of austerity policies implemented at a time of panic at seeing financing of the public debt dry up, the sovereign debt crisis is threatening the euro zone with a prolonged recession in 2012 and 2013. And the even worse scenario looming on the horizon – the disintegration of the euro zone – would transform the threats of recession into the risk of a major depression.

Assessments of the situation differ depending on the elements available. Some measures have been implemented by decree, while others are being discussed by the legislature, but the

proposed bills do permit a quantitative analysis. Others are in the planning stage, with the main trade-offs still to be made, so our assessment tries to explore the main points.

Our assessment of the economic strategy for the five-year programme does not stop there. The outlines of the premises for a strategy to end the crisis can now be seen. The deficit reduction commitments and the initial steps taken in this direction in the budget packages in July 2012, such as those announced during the budget orientation debate of June 2012, point to a strategy whose first step is the achievement of a reduction in the public deficit to 3% of GDP by the end of 2013, regardless of the cost. Based on this fiscal virtue, this amounts to a strategy to end the crisis by stabilizing the state of the public accounts, thereby reassuring the financial markets and other economic agents and establishing the conditions for a strong future recovery. This strategy is based on cutting public expenditures and raising taxes (see the "public finance" section, government tax proposals and the taxation of the oil companies).

This strategy for ending the crisis is risky, to say the least, because it does not take full account of the crisis facing Europe today. It might be justified if we were already on course to end the crisis and if the point were simply to set priorities. But Europe remains in a situation of extreme uncertainty, living in the expectation of a massive failure of one or another Member State in the euro zone, fearing the collapse of this or that financial institution, and suffering the consequences of a spiral of austerity that is being fueled by rising sovereign interest rates. In this situation, everything is coming together to strengthen the existence of a liquidity trap and to generate high fiscal multipliers. Given this, *ex ante* reductions in the deficit through tax hikes and spending cuts is weighing heavily on activity, and thus limiting or even cancelling out any actual deficit reductions. The factors pushing up the public debt are not being reversed,

and the reduction in activity is heightening the risk that the unsustainable private debt will be socialized. The increase in sovereign interest rates is being fueled by an inability to meet deficit reduction targets and by rising public debt, and is thus pushing public deficits higher, forcing even more austerity.

One response to this dynamic that is bringing about the collapse of the euro would be one form or another of pooling public debts in Europe. This would require relatively complete control of the budgets of member countries by a federal body with strong democratic legitimacy. A response like this would therefore mean "more Europe", and would make it possible to define "more moderate" austerity policies for France as well as its major trading partners. It would make putting an end to involuntary mass unemployment and the liquidity trap prerequisites to an improvement in the public finances. It would also make it possible to ensure the sustainability of public finances without leading to the lost decades that are now gestating.

In the first part of the Note, we analyze the macroeconomic context for François Hollande's five-year programme and the XIVth legislature. This analysis details the likely consequences for the next five years of the strategy currently being implemented in Europe. The value of the fiscal multiplier is a critical parameter, and we show that the current strategy is valid only if the multipliers are low (*i.e.* on the order of 0.5). However, a slew of empirical evidence indicates that, in the exceptional situation we are experiencing today, the budget and fiscal multipliers may be larger than 0.5 (between 1 and 1.5, see the Note). We detail in a second part the measures taken in the Supplementary Budget Act of July 2012 (for 2012) and the elements outlined in the budget orientation debate in preparation for the Budget Act for 2013 and for the period 2012-2017. To succeed in reducing the public deficit to 3%, it seems that there must be

over 10 billion euros in additional tax revenue or in savings on expenditure, *ex ante*.

We then present an evaluation of eleven measures. Guillaume Allègre, Marion Cochard and Mathieu Plane have estimated that the implementation of the *contrat de génération* ["generation contract"] could create between 50,000 and 100,000 jobs, at the cost of a strong deadweight effect. Eric Heyer and Mathieu Plane point out that in the short term, subsidized *emplois avenir* ["jobs for the future"]-type contracts can help to reduce unemployment. Eric Heyer shows that the revision of taxation on overtime will help to cut the public deficit by 4 billion euros, without hurting the labour market. Guillaume Allègre discusses the consequences of increasing the *Allocation de rentrée scolaire* [allowance for the start of school] and shows that it mainly benefits the lowest five deciles in terms of standard of living. Henri Sterdyniak analyzes the possibilities for fiscal reform. The point is not to evaluate the government's proposals for fiscal reform, but to provide a comprehensive overview of the current system's margin for change and its inconsistencies. Henri Sterdyniak and Gérard Cornilleau evaluate the increased opportunities for retiring at age 60 and analyze the possible paths to a more large-scale reform of the pension system. Hélène Périvier evaluates the possibilities for an early childhood public service, the eventual cost of which could be covered in part by an increase in activity that would generate more than 4 billion euros. Eric Heyer and Mathieu Plane analyze the impact of a boost in the minimum wage (SMIC) and conclude that, given the small spillover of increases in the SMIC onto the rest of the wage structure, the impact on the cost of labour is limited by the greater reduction in social charges on low wages. While the effect on employment is small, it would cost the public purse 240 million euros. Sabine Le Bayon, Pierre Madec and Christine Riffart evaluate rent control. Hervé Péléraux discusses the compensation of Livret A bank accounts and the impact of doubling their ceiling. Céline Antonin and

Evens Salies evaluate the new taxes on the oil companies, which could provide 550 million euros in tax revenue in 2012, at the risk that this tax might ultimately be passed on to the end consumer.
